TM-732A/E

CIRCUIT DESCRIPTION

Outline

The TM-732A/E are 144/430MHz FM dual band car transceivers designed for armature radio communications.

• Features

1. Complete compact dual band function.
2. The extended cable kit (option) can be used to disconnect the panel with one touch of a finger. Free setting is made possible.
3. Independent receiving function enables the simultaneous receiving of 144MHz and 430MHz bands. (Both bands independent, full display, volume, squelch, signaling, external loudspeaker.)
4. Large LCD (68.0 x 19.0 mm).
5. Simple operation like monoband type.
6. Both 144MHz and 430MHz bands can be received at a time.
7. Duplexer built in (Types K and P excluded).
8. S-meter squelch function built in. Switching to noise squelch provides the adjustment of S-meter squelch level with a squelch volume.
9. With a maximum of 64 memory channels, the switching of a memory channel mode permits changing the number of split and normal memory channels for each band. (50 channels in full split memory)
10. DTSS and paging functions built in.
11. Wire (microphone jack connected) and wireless (DTMF) coulomb function built in.

CIRCUIT DESCRIPTION

Frequency Configuration

The TM-732A/E has separate PLL and IF units for the VHF and UHF bands, so it can receive signals on both bands at the same time. It has a VHF sub-receiver to receive a UHF signal in the VHF band and a UHF sub-receiver to receive the VHF band signal in the UHF band.

The 144MHz band receiver mixes the received signal with the first local oscillation frequency of 189.05 to 193.045MHz (K,P,M), 189.05 to 191.045MHz (E) to produce the first intermediate frequency of 45.05MHz. The signal is then mixed with the second local oscillation frequency of 45.505MHz to produce the second intermediate frequency of 455kHz.

The 430MHz band receiver mixes the received signal with the first local oscillation frequency of 379.475 to 391.47MHz (K,P), 371.475 to 381.47MHz (M,E) to produce the first intermediate frequency of 58.525MHz. The signal is then mixed with the second local oscillation frequency of 58.0MHz to produce the second intermediate frequency of 455kHz.

The 144MHz band sub-receiver mixes the received signal with the first local oscillation frequency of 202.525 to 206.52MHz (K,P,M), 202.525 to 204.52MHz (E) to produce the first intermediate frequency of 58.525MHz. The signal then goes to the second intermediate frequency section of the UHF receiver to produce the second intermediate frequency of 455kHz.

The 430MHz band sub-receiver mixes the received signal with the first local oscillation frequency of 392.95 to 404.945MHz (K,P), 384.95 to 394.945MHz (M,E) to produce the first intermediate frequency of 45.05MHz. The signal then goes to the second intermediate frequency section of the VHF receiver to produce the second intermediate frequency of 455kHz.

The receivers and sub-receivers for the 144 and 430MHz bands all use double conversion. The transmitter contains a PLL circuit that directly generates and divides down carriers for both bands. The transmission signals are amplified by a linear amplifier and transmitted. The main circuits are used to transmit signals even if a sub-band is being used.

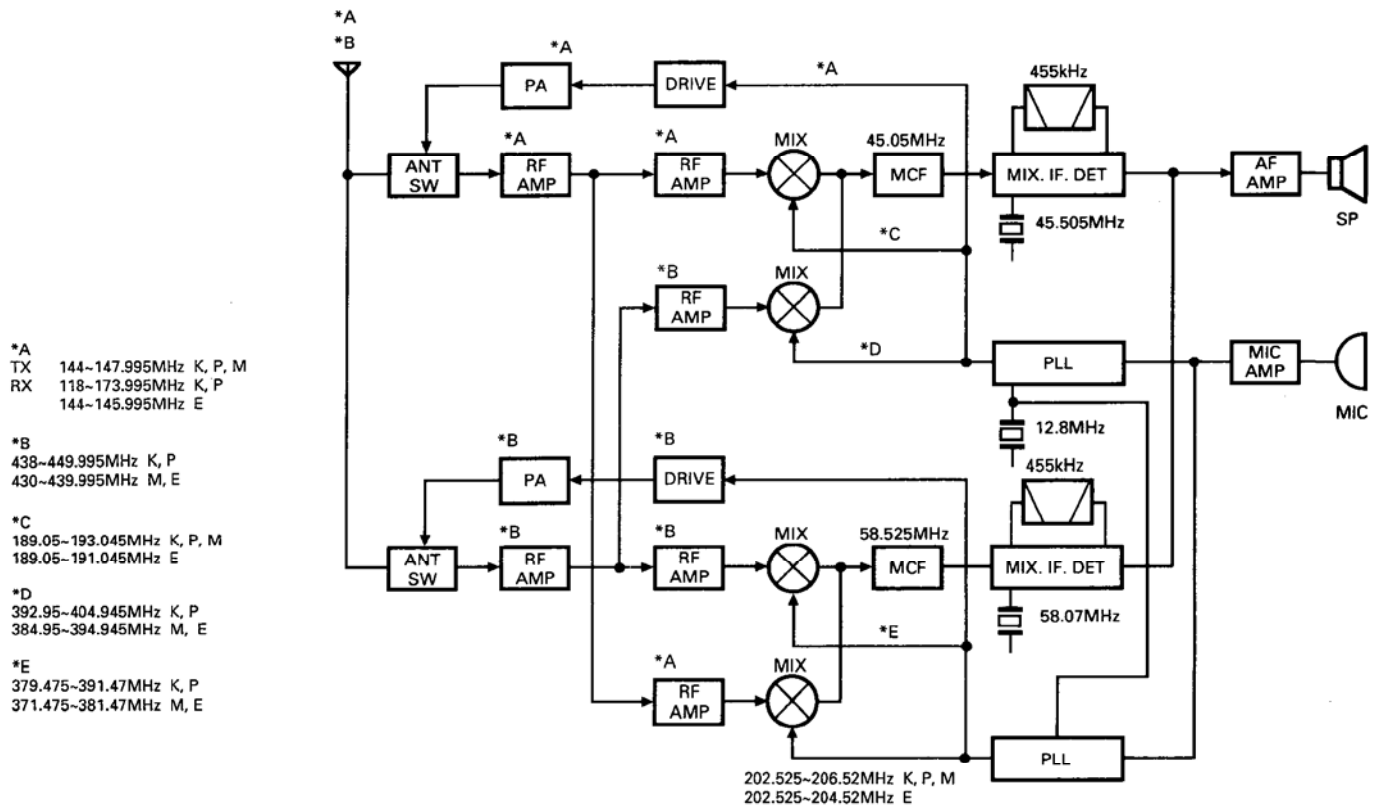

Fig.1 Frequency configuration

CIRCUIT DISCRIPTION

144MHz Band Transmit Circuit

- **Outline**

The transmit circuit produces the desired carrier frequency directly, and directly modulates its frequency by means of a vari-cap diode.

- **Modulator circuit**

The audio signal amplified and limited by the control unit passes through a splatter filter, is mixed with the sub-tone from the microcomputer, and input to PLL unit (KCH11) IC9. The PLL unit directly modulates the carrier frequency with the input audio signal by using a vari-cap diode to control the frequency of the VCO.

- **Younger-stage circuit**

The signal output from the PLL unit goes to drive circuit HIC IC10 (KCB11). The HIC can provide a stable drive output for the final module without adjustment because it has a large bandwidth.

- **Power amplifier circuit**

The drive signal input to the power module according to the output power is amplified to the specified level.

- **APC and power switching circuits**

The automatic transmission output control circuit (APC) detects and partially amplifies the transmission output with a diode, and controls the DB voltage for the drive stage and final module to keep the transmit output constant. The power switching circuit can switch the power by changing the setting resistor for the APC control voltage with a signal from the shift register (IC8).

430MHz Band Transmit Circuit

- **Outline**

The transmit circuit produces the desired carrier frequency directly and directly modulates its frequency by means of a vari-cap diode.

- **Modulator circuit**

The audio signal amplified and limited by the control unit passes through a splatter filter, is mixed with the sub-tone from the microcomputer, and input to PLL unit (KCH12) IC207. The PLL unit directly modulates the carrier frequency with the input audio signal by using a vari-cap diode to control the frequency of the VCO.

- **Younger stage circuit**

The signal output from the PLL unit goes to drive circuit HIC IC209 (KCB14). The HIC can provide stable drive output for the final module without adjustment because it has a large bandwidth.

- **Power amplifier circuit**

The drive signal input to the power module according to the output power is amplified to the specified level.

- **APC and power-switching circuits**

The automatic transmission output control circuit (APC) detects and partially amplifies the transmission output with a diode, and controls the DB voltage for the drive stage and final module to keep the transmit output constant. The power switching circuit can switch the power by changing the setting resistor for the APC control voltage with a signal from the shift register (IC206). To protect the high power model from excessive temperature rise, there is a thermal switch to reduce the power automatically if the temperature reaches a certain level.

CIRCUIT DESCRIPTION

144MHz Band Receive Circuit

The received 144MHz band signal from the antenna passes through a transmission/reception selection diode switch. The signal then passes through an antenna matching coil in the receiver front end and a divider, and is amplified by a GaAs (gallium arsenide) field-effect transistor. The unwanted components of the signal are eliminated by a band-pass filter consisting of a three stage variable capacitor. The resulting signal goes to the first mixer, is mixed with the first local oscillator signal from the PLL circuit, and so converted to the first intermediate frequency of 45.05MHz. The unwanted near by signal components are eliminated by a two stage MCF.

The first intermediate frequency signal is amplified and input to FM IF HIC IC1 (KCD04). This signal is then mixed with the second local oscillation frequency of 45.505MHz to produce the second intermediate frequency signal of 455kHz. The unwanted near by signal components are eliminated by an FM ceramic filter. The resulting signal is input to IC1 again, amplified, and detected to produce an audio signal.

• Signal strength meter

The signal strength meter output voltage of FM IF HIC IC1 (KCD01) is input to the control unit. It is then digitized to drive the bar meter of the LCD.

Item	Rating
Center frequency	45.050MHz
Pass bandwidth	±7.5kHz or more at 3dB
Attenuation bandwidth	±22kHz or less at 25dB
Guaranteed attenuation	80dB or more within Fo - 910kHz (Spurious : ±1MHz at 40dB or more)
Ripple	1dB or less
Insertion loss	4dB or less
Terminating impedance	800kΩ ± 10%, 2pF ± 10%

Item	Rating
Nominal center frequency	455kHz
6dB bandwidth	±6.0kHz or more (from 455kHz)
50dB bandwidth	±12.5kHz or less (from 455kHz)
Ripple	3dB or less (within ±5kHz of 455kHz)
Insertion loss	6dB or less (at maximum output point)
Guaranteed attenuation	35dB or more (within ±100kHz of 455kHz)
I/O matching terminating impedance	2.0kΩ

Table 2 Ceramic filter CFWM455F (L72-0372-05) (TX-RX unit CF1)

430MHz Band Receive Circuit

The received 430MHz band signal from the antenna passes through a filter in the final unit and a transmission/reception selection diode switch. The signal then passes through an antenna matching coil in the receiver front end, is amplified by a GaAs (gallium arsenide) field-effect transistor and joint type FET, and passes through two 2 pole dielectric filters. The resulting signal goes to the first mixer, is mixed with the first local oscillator signal from the PLL circuit, and so converted to the first intermediate frequency of 58.525MHz. The unwanted near-by signal components are eliminated by a two stage MCF. The first intermediate frequency signal is amplified and input to FM IF HIC IC201 (KCD04). This signal is then mixed with the second local oscillation frequency of 58.07MHz to produce the second intermediate frequency signal of 455kHz. The unwanted near by signal components are eliminated by a ceramic filter. The resulting signal is amplified, and detected to produce an audio signal.

• Signal-strength meter

The signal strength meter output voltage of FM IF HIC IC201 (KCD04) is input to the control unit micro-computer to drive the signal strength meter.

Item	Rating
Center frequency	58.525MHz
Pass bandwidth	±8.5kHz or more at 3dB

CIRCUIT DISCIPTION

144MHz Band Sub Receive Circuit

The received signal from the antenna goes to the receiver front end for the 144MHz main band. The signal is amplified by a GaAs (gallium arsenide) field-effect transistor (Q1), input to the main 144MHz main circuit and sub circuit by the divider circuit, and input to the 430MHz band sub circuit. The unwanted signal components are eliminated by the filter circuit of the sub-receive circuit, and the resulting signal is amplified

by transistor Q211. The unwanted signal components are further eliminated by another filter circuit. The resulting signal is then mixed with the first local oscillation frequency by the FET (Q212) mixer to produce the first intermediate frequency signal of 58.525MHz. The signal is input to the 430MHz band main circuit, and the 144MHz sub band signal is received by the main circuit.

Fig. 2 144MHz band sub receive circuit block diagram

430MHz Band Sub Receive Circuit

The 144MHz unit can receive 430MHz band signals. The received signal from the antenna passes through a transmission/reception selection diode switch in the final section of the 430MHz unit. The signal then passes through an antenna matching coil, and is amplified by a GaAs (gallium arsenide) field-effect transistor (Q201). The amplified receive signal passes through a

divider, and is amplified by IC3 (high frequency wide-band amplifier) of the 144MHz unit. The unwanted signal components are removed by a band-pass filter. The resulting signal goes to the first mixer, is mixed with the first local oscillator signal from the PLL circuit, and so converted to the first intermediate frequency of 45.05MHz. The subsequent receive operation is the same as for the 144MHz band.

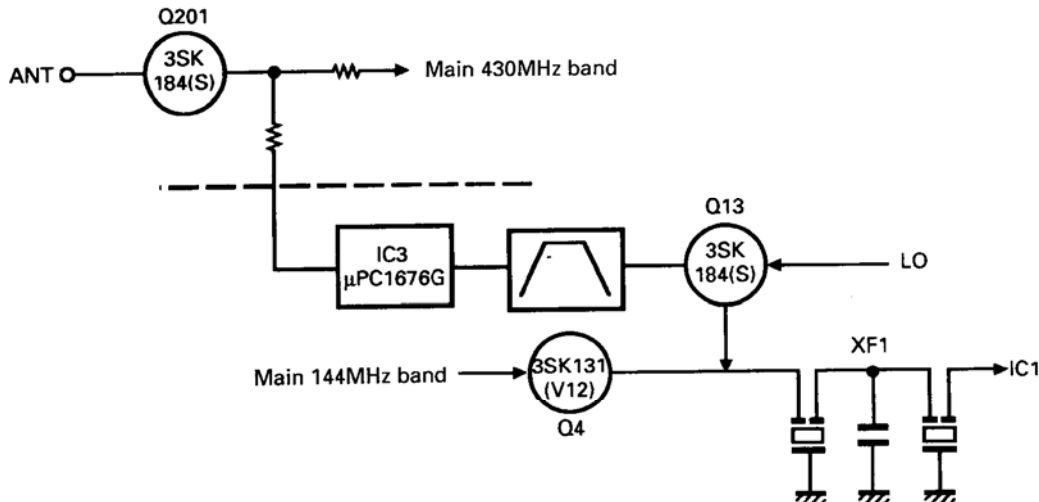

Fig. 3 430MHz band sub receive circuit block diagram

CIRCUIT DISCRIPTION

Squelch Circuit

The panel unit microprocessor reads the angle of rotation of the squelch VR, and converts it to a 6 bit digital value. The panel unit microprocessor transfers

the data to the control unit microprocessor, which in turn transfers the data to IC5 (BU4094BF). The data is converted to analog by analog switch IC4 (BU4066BF) according to the output from IC5.

Fig. 4 Squelch circuit

144MHz Band Shift Register Circuit

The ES, CK, and DT serial data from the control unit is sent to IC8 (BU4094BF) to perform the control operations outlined in the following table.

Pin No.	Name	Function
1	Strobe	Enable input
2	Data	Serial data input
3	Clock	Clock input
4	Q1	TX/RX selection. Low when TX is set
5	Q2	TX power selection "L" : MID and LOW power, "H" : HI power

15	QE	8V
16	VDD	8V

CIRCUIT DESCRIPTION

SQL Circuit

The SQL circuit varies the voltage output from IC201 (KCD04) by the electronic VR with the same analog switch as used for the 144MHz band.

144MHz Band 8T/8R Switching Circuit and Unlock Circuit

A high signal is applied to the base of Q15 and Q19 from the shift register during reception, Q16 is turned on, 8R is output, and Q18 and Q17 are turned off. 8T is not output. 8R is turned off, and 8T is turned on during transmission. The unlock signal is input to Q19 from the PLL unit. When the PLL is unlocked, this signal goes high. So, 8T is not turned on, and transmission does not occur even if a signal arrives from the shift register.

Fig. 5 144MHz band 8T/8R switching circuit and unlock circuit

430MHz Band 8T/8R Switching Circuit and Unlock Circuit

A high signal is applied to the base of Q215 and Q214 from the shift register during reception, Q216 is turned on, 8R is output, and Q217 and Q218 are turned off. 8T is not output. 8R is turned off, and 8T is turned on during transmission. The unlock signal is input to Q214 from the PLL unit. When the PLL is unlocked, this signal goes high. So, 8T is not turned on, and transmission does not occur even if a signal arrives from the shift register.

Fig. 6 430MHz band 8T/8R switching circuit and unlock circuit

AF Signal System

• Outline

Detection signals RAV and RAU from the 144MHz and 430MHz units go to the mute and beep circuits of the control unit. The signals pass through the electronic VR, analog signal switching circuit, and speaker switching circuit of the 144MHz unit, and are output to the power amplifier and speaker.

• Beep and mute circuits

To sound the beep when a key is pressed, a pulse is output from P20 of the CPU, mixed with the output through the buffer (Q401) of monitor IC401 (DTMF encoder) for DTSS operation, passed through the beep mute circuit (Q405 and Q406) for each band, mixed with the detection signal for each band, and sent to the electronic VR. The audio mute circuit (Q404 and Q409) for each band works only when the beep sound is output from the CPU. The signal output from the electronic VR passes through analog switch IC404 and the audio mute circuit (Q402 and Q403), and is output to the speaker switching circuit. The CPU transfers data to the electronic volume in the same way as for the TM-941.

CIRCUIT DIScription

Fig. 7 AF signal system block diagram

Digital Control Unit

• Outline

The digital control unit controls functions with a single microprocessor (CPU). It consists of the tone output circuit, DTMF encode/decode circuit, electronic VR circuit, and analog signal switching circuit. It contains the reset and backup circuits, microphone amplifier circuit, and microphone key input circuit.

Speaker switching circuit

The 144MHz unit has two speaker jacks, J1 and J2. AF signals can be output to various combinations of speakers, including the internal speaker. If no external

speaker is connected to J1, pins 10 and 11 of IC7 go low, and AF signals AO0 and AO1 from the control unit are added. The resulting signal goes to power amplifier IC6. If an external speaker is connected to J1, pins 10 and 11 of IC7 go high, and AO0 and AO1 are input to IC6 separately.

Combinations of AF signals are listed below.

	AO0	AO1
Internal speaker only	Internal speaker	
External speaker (J2)	External speaker	
External speaker (J1)	Internal speaker	External speaker
Internal speakers (2)	External speaker	External speaker

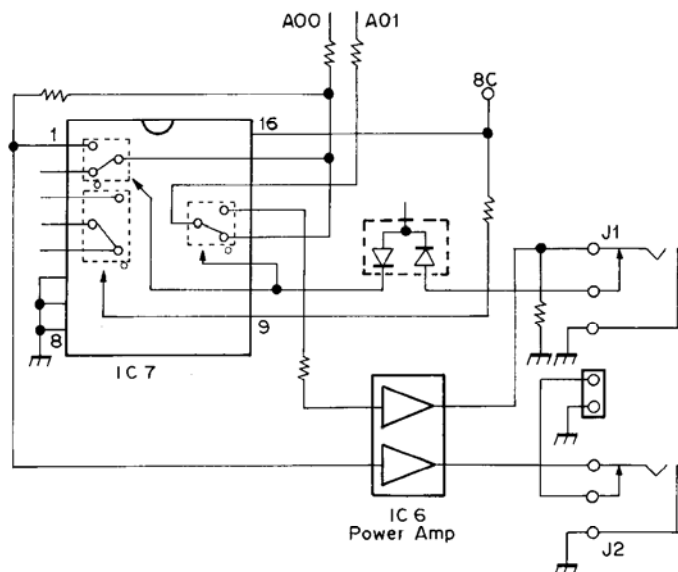

Fig. 8 Speaker switching circuit

CIRCUIT DESCRIPTION

Tone Output Circuit

The signal is input to R402 (ladder resistor) from P61 to P63, and P70 to P73 of the CPU, and converted from digital to analog to produce 38 signals of 67.0 to 250.3Hz. Figure 9 shows the internal configuration of R402.

Fig. 9 Internal configuration of R402

DTMF Encode/Decode Circuit

• DTMF encode/decode circuit

Data is transmitted to IC401 (LR4089BN) from P40 to P43, and P50 to P53 of the CPU, and a DTMF signal is output from IC401.

• DTMF decode circuit

When the received signal or a signal from the DTMF microphone (option) enters IC402 (LC7385M) and an effective tone pair is detected, STD goes high, is input to RIZ of the CPU, and data is read into P90 to P93.

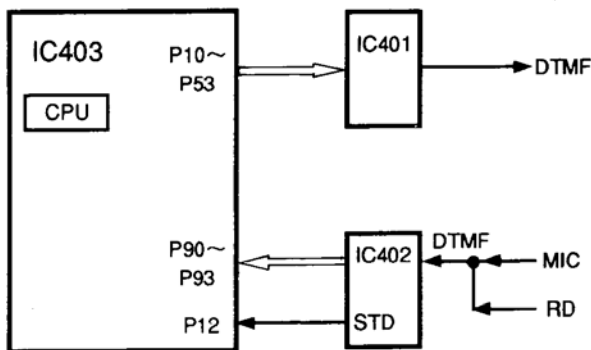

Fig. 10 DTMF encode/decode circuit

Analog Signal Switching Circuit

IC404 switches the audio signal and DTMF MIC/RD, and IC405 switches between V/U of MIC RD, DTMF RD, and CTCSS RD.

• Audio signal switching

Switches the VHF AF signal and UHF AF signal from the electronic VR to AO1 or AO0.

• DTMF MIC/RD switching

Switches the DTMF decoder IC input to the DTMF signal in the detection signal or the DTMF signal from the microphone.

• MIC RD V/U switching

Switches the signal output from microphone pin RD to RDV or RDU.

• DTMF RD V/U switching

Switches the DTMF decoder IC input to RDV or RDU.

The signal passes through this circuit and the DTMF MIC/RD switching circuit, and goes to the DTMF decoder IC. When switching to either RDV or RDU, the signal is switched to the band for which a busy sense signal (SC) is being input to the CPU. If busy sense signals for both bands are being input to the CPU at the same time, the last detected band is used.

• CTCSS RD V/U switching

Switches the signal to the CTCSS unit (TSU-7 option) to RDV or RDU. When switching to either RDV or RDU, the signal is switched to the band for which a busy sense signal (SC) is being input to the CPU. If busy sense signals for both bands are being input to the CPU, the circuit is switched in 500msec intervals.

P101 (Audio signal switching)	H : AO0=VHF AF, AO1=UHF AF L : AO0=UHF AF, AO1=VHF AF
P100 (DTMF MIC/RD switching)	H : DTMF signal in the detection signal L : DTMF signal from microphone
P110 (MIC RD V/U switching)	H : RDV L : RDU
P103 (DTMF RD V/U switching)	H : RDV L : RDU
P102 (CTCSS RD V/U switching)	H : RDV L : RDU

CIRCUIT DESCRIPTION

Fig. 11 Analog signal switching circuit

Reset and Backup Circuits

When the power supply is connected, a low level pulse of about 3msec duration is output by the reset circuit. This pulse goes to RESET of the CPU for

power-on reset. When the power supply is disconnected, the voltage drop of the 13.8V line is detected, and INT4 of the CPU goes high. The CPU enters the backup mode.

Fig. 12 Reset and backup circuits

Microphone Amplifier Circuit

The audio signal from the microphone goes to three operational amplifiers. These amplifiers constitute a pre-emphasis circuit, amplifier, limiter, and splatter circuit that eliminates unwanted high frequency components.

The modulator circuit directly modulates the frequency of the VCO for both the 144 and 430MHz bands by means of a vari-cap diode.

Fig. 13 Microphone amplifier circuit

CIRCUIT DESCRIPTION

Microphone Key Input

The microphone UP, DOWN, and function keys are connected to the analog input of the CPU, and each function is activated according to the voltage applied when a key is pressed.

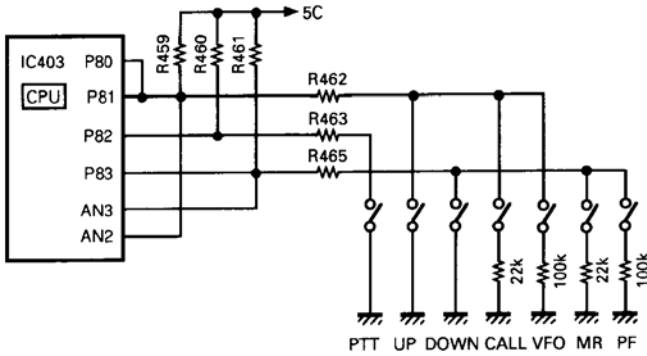

Fig. 14 Microphone key input

Panel Unit

• Outline

The panel unit controls the display circuit, memory, and dimmer circuit with a microprocessor. The keys and the rotary encoder are connected directly to the microprocessor.

Dimmer Circuit

The dimmer circuit can change the brightness of the lamp in four steps, and turn the lamp off. Q3 amplifies the error of the stabilized power supply using a 5V reference voltage. The output voltage can be controlled in four steps by grounding a combination of the BP2 and BP3 ports of the microprocessor. If the impedance of BP1, connected to the emitter of Q2, is made high, Q2 is turned off. No lamp voltage is output, and the lamp goes off.

Fig. 15 Dimmer circuit

Reset Circuit

When the power supply is connected, the IC1 (L78LR05B-FA) output (pin5) becomes 5V, and after about 100msec, RESET (pin4) goes high. The signal is input to the RESET pin of the CPU (IC4) to reset it.

Key and Rotary Encoder Input Circuit

Each panel key signal is input from its own port. The MR, VFO, and MHz keys are pulled up by external resistors (the PSW key is pulled down), and the other keys are pulled up by software. The rotary encoder inputs signals directly to the microcomputer.

Display Circuit

The display circuit consists of the CPU, LCD driver and peripheral circuits, and LCD. The LCD is driven dynamically with 1/2 duty. Part of the display is controlled by the CPU (IC4), and part is controlled by the LCD driver (IC5), as shown in the figure. Data is transferred serially from P40, P41, and P42 of the CPU to the LCD driver.

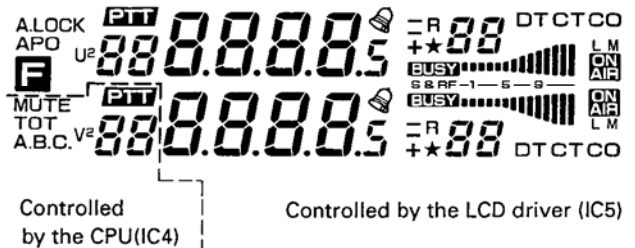

Fig. 16 Display LCD

Memory

Memory channel data is stored in IC6 (non volatile memory). Data is written according to the serial data from P31, P32, and P33 of the microcomputer (IC4), and is read by P23.

CIRCUIT DISCRPTION

430MHz Band PLL Synthesizer

The VCO and PLL circuits comprise a hybrid integrated circuit housed in a solid shielded case. Comparison frequencies are produced by dividing a 12.8MHz reference frequency from the 144MHz band unit to correspond to the 5, 10, 15, 20, 12.5, and 25kHz channel steps.

When UHF band signals are received, 379.475 to

391.47MHz (K,P), 371.475 to 381.47MHz (M, E) is generated, and when UHF band signals are transmitted, 438.00 to 449.995MHz (K,P), 430.00 to 439.995MHz (M,E) is generated. When VHF sub band signals are received, the VCO in the PLL unit stops, and the VHF sub VCO on the mother board is operated to produce 202.525 to 206.52MHz (K,P,M), 202.525 to 204.52MHz (E).

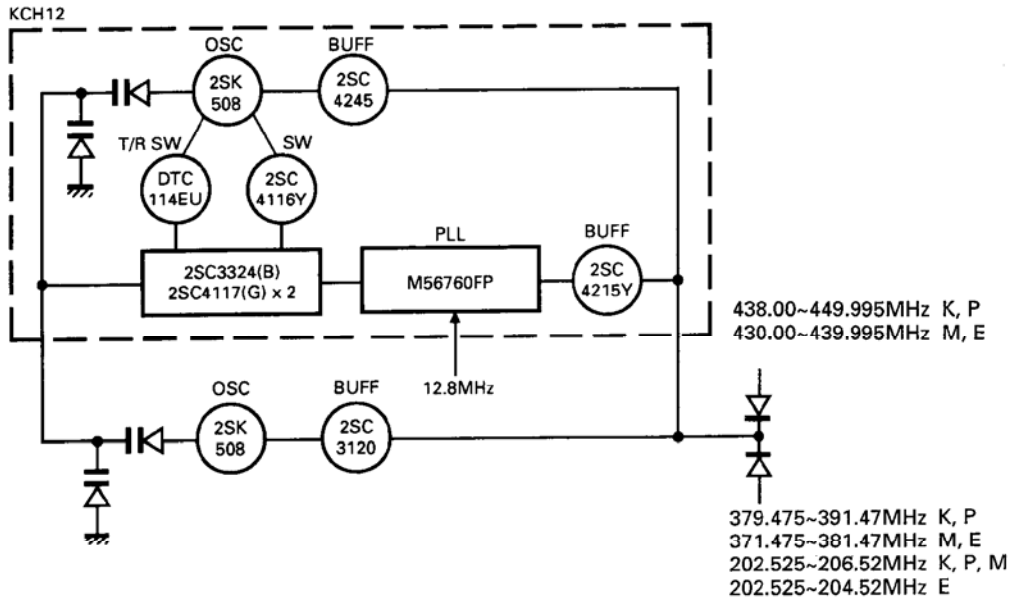

Fig. 17 430MHz band PLL block diagram

144MHz Band PLL Synthesizer

The VCO and PLL circuits comprise a hybrid integrated circuit housed in a solid shielded case. X2 (12.8MHz) is generated by the PLL IC (M56760FP) in the HIC, and is divided to produce a 5 or 6.25kHz reference frequency. Part of the 12.8MHz output is passed through the buffer amplifier, and goes to the 430MHz unit.

Comparison frequencies are produced by dividing

X2 to correspond to the 5, 10, 15, 20, 12.5, and 25kHz channel steps. When VHF band signals are received, 189.05 to 193.045MHz (K,P,M), 189.05 to 191.045MHz (E) is generated, and when VHF band signals are transmitted, 144.00 to 147.995MHz (K,P,M), 144.00 to 145.995MHz (E) is generated. When UHF sub band signals are received, a lock is established at twice the VCO oscillation frequency to produce 379.475 to 391.47MHz (K,P), 371.475 to 381.47MHz (M,E).

IC407	6V AVR	
IC408, IC409	Serial data inverter	
IC410, IC411	Low-frequency amplifier (microphone)	
D1~D5	Vari-cap tuner	
D6	Heterodyne switch	
D7	Reference voltage	
D8	Reverse-flow prevention	
D9	Voltage correction	
D10	Heterodyne switch	Transmit/receive switch
D11	Reverse-flow prevention	
D12	APC temperature compensation	
D13, D14	Antenna selection switch	
D15, D16	Power detection	
D201 *	RF switch	
D202	Reverse-flow prevention	

DESCRIPTION OF COMPONENTS

Ref. No	Use/Function	Operation/Condition compatibility
D203	IF level limiter	
D204, D205	Heterodyne switch	
D206, D207	Reverse-flow prevention	
D210	Heterodyne switch	
D211	APC temperature compensation	
D212	Reverse-flow prevention	
D213, D214	Antenna selection switch	
D215, D216	Power detection	
D217	Reverse power connection prevention	
D401, D402	Reverse-flow prevention	
D403	Backup detection	
D404	Reset detection	
D405	Reverse-flow prevention	
D406	Microprocessor protection	
D407	Reverse-flow prevention

MODIFICATION

Cloning Function

• Wired cloning (Modification not required)

Cloning cable

Operation

1. Write memory data into the master transceiver.
2. Switch the power off, hold down the F and MHz keys, and switch the power on again. The frequency display shows "CLonE".
3. Set the slave transceiver to clone mode in the same way.
4. Connect the microphone jacks of the two transceivers with a cloning cable.
5. Press the CALL key on the master transceiver. The "ON AIR" indicator lights, and cloning starts. When data output ends, a beep sounds, and "End" is displayed. When the writing of all channel data finishes, a beep sounds, and "End" is displayed.

Note : Cloning is possible only between TM-732s.

Memory channel modes, the number of channels for each band, and all memory channel data are cloned.

• Cloning with transceiver (DTMF) (Modification required)

Operation

1. Write data into the master transceiver, and specify the transmit band and transmit frequency.
 2. Switch the power off, hold down the CALL and BELL keys, and switch the power on again. Clone receive mode is entered, and "CLonE" is displayed on the frequency display for the band other than the transmit band.
 3. Set the receive frequency of the slave transceiver to the transmit frequency of the master transceiver, hold down the CALL and BELL keys, and switch the power on.
 4. Press the PTT key on the master transceiver. The power goes low automatically and transmission starts. (The remaining data is displayed on the signal-strength meter display.)
 5. When all the data has been output, a beep sounds, and "End" is displayed.
 6. When all the data has been written into the slave transceiver, a beep sounds, and "End" is displayed.
- Note : If the signal breaks during reception, a beep sounds, and "Err" is displayed.

PACKING

ADJUSTMENT

Required Test Equipment

1. **DC V.M and Tester**
 - 1) High input impedance
2. **RF VTVM (RF V.M)**
 - 1) Input impedance : 1M Ω min. 2pF max.
 - 2) Voltage range : F.S = 10mV to 300V
 - 3) Frequency range : Up to 450MHz
3. **Frequency Counter (f. counter)**
 - 1) Input sensitivity : Approx. 50mV
 - 2) Frequency range : Up to 450MHz
4. **DC Power Supply**
 - 1) Voltage : 10V to 17V, variable
 - 2) Current : 6A min.
5. **Power Meter**
 - 1) Measurement range : Approx. 60W, 3W, 1W
 - 2) Input impedance : 50 Ω
 - 3) Frequency range : 450MHz
6. **AF VTVM (AF V.M)**
 - 1) Input impedance : 1M Ω min.
 - 2) Voltage range : F.S = 1mV to 30V
 - 3) Frequency range : 50Hz to 10kHz
7. **AF Generator (AG)**
 - 1) Output frequency : 100Hz to 10kHz
 - 2) Output voltage : 0.5mV to 1V
8. **Linear Detector**
 - 1) Frequency range : 450MHz
9. **Spectrum Analyzer**
 - 1) frequency range : 450MHz
10. **Directional Coupler**
11. **Oscilloscope**
 - 1) High sensitivity oscilloscope with horizontal input terminal
12. **SSG**
 - 1) Frequency range : 144/430MHz band
 - 2) Modulation : AM and FM MOD.
 - 3) Output level : -20dB μ ~100dB μ
13. **Dummy Load**
 - 1) 8 Ω , 5W (approx.)
14. **Noise Generator**
 - 1) Must generate ignition-like noise containing harmonics beyond 450MHz.
15. **Sweep Generator**
 - 1) Sweep range : 144/430MHz bands
16. **Tracking Generator**

Preparation

- Set controls to position shown in Table unless otherwise specified.

POWER SW	OFF
AF VOL VR	MIN
SQL VOL VR	MIN

Microphone Socket (on Front Panel)

- Use an insulated tool such as a plastic tool during adjustment (especially trimmer coil adjustment).
- For SSG protection, do not connect a microphone to the microphone socket during receiver block adjustment.
- Check that the power switch is off before the power cord is connected.
- The SSG output level is displayed at the release end.

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Frequency table		Destination		Frequency range (MHz)		Transmission power (W)		
				144MHz band	430MHz band	144MHz band	430MHz band	
		K,P	TX	144.00~147.995	438.00~449.995	50	35	
			RX	118.00~173.995				
		M		144.00~147.995	430.00~439.995	50	35	
		M2,M3,E2	TX	136.00~173.995	410.00~469.995	50	35	
			RX	118.00~173.995				
		E,E3		144.00~145.995	430.00~439.995	50	35	
2. Setting Reset Memory	<p>1) Power voltage : 13.8V VOL, SQL knob : Fully counterclockwise</p> <p>2) While pushing MR key, turn on POWER. Upon confirming that all have lit up, turn off POWER.</p> <p>3) While pushing F key and MR key, turn on POWER. Wait there for about 4 seconds (until memory is set to production mode).</p> <p>4) Without specification of SSG, standard modulation is applied (MOD : 1kHz, DEV : ±3kHz).</p>							
3. Memory frequency (production mode)		VHF band (V band)		UHF band (U band) : M,M2,M3,E,E2,E3		UHF band (U band) : K,P

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
5. Transmission frequency	1) U band CH3 : 435.000MHz M,M2,M3,E,E2,E3 CH3 : 445.000MHz K,P	f. counter Dummy load	Rear panel	ANT	TX-RX (A/4)	TC1	435.000MHz M,M2,M3,E,E2,E3 445.000MHz K,P	±100Hz
6. BPF	1) V band CH5 : 145.040MHz E,E3 CH9 : 145.940MHz K,P,M,M2,M3,E2 SSG : Lowering SSG from 0dBμ, adjust it between -7~-8dBμ.	DVM SSG	TX-RX (A/4)	SM	TX-RX (A/4)	L5-7 L10	Voltage MAX	Ref. value : approx. 2.5V
	2) U band CH4 : 435.040MHz M,M2,M3,E,E2,E3 CH4 : 445.040MHz K,P SSG : Lowering SSG from 0dBμ, adjust it between -7~-8dBμ.		TX-RX (B/4)	SM	TX-RX (B/4)	TC201 L214		
7. Sensitivity	1) V band E,E3 CH3 : 144.040MHz CH9 : 145.940MHz CH5 : 145.040MHz K,P,M,M2,M3,E2 CH3 : 144.040MHz CH9 : 145.940MHz CH11 : 147.940MHz SSG : -9dBμ	Distortion meter Oscilloscope Voltmeter	Rear panel	EXT. SP			Check	SINAD 12dB or more.
	2) U band M,M2,M3,E,E2,E3 CH2 : 430.040MHz CH4 : 435.040MHz CH8 : 439.940MHz K,P CH2 : 438.040MHz CH4 : 445.040MHz CH8 : 449.940MHz SSG : -9dBμ							SINAD 12dB or more.
	3) Display control unit LED lighting on V2 or U2 with F key, CONT SEL key. After check, return to the original state with F key, CONT SEL key. Switching the LED lit side with SEL key, set a band for confirmation with F key, CONT SEL key, once again. V2 band CH14 : 145.080MHz SSG : -3dBμ							SINAD 12dB or more.
	4) U2 band CH11 : 435.080MHz M,M2,M3,E,E2,E3 CH11 : 445.080MHz K,P SSG : -3dBμ							SINAD 12dB or more.

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks	
		Test-equipment	Unit	Terminal	Unit	Parts	Method		
8. High level input S/N	1) V band CH5 : 145.040MHz E,E3 CH9 : 145.940MHz K,P,M,M2,M3,E2 SSG : 60dB μ AF output : 2.83V/8 Ω	Oscilloscope Voltmeter SSG	Rear panel	EXT. SP			Check	S/N 44dB or more.	
	2) U band CH4 : 435.040MHz M,M2,M3,E,E2,E3 CH4 : 445.040MHz K,P SSG : 60dB μ AF output : 2.83V/8 Ω							S/N 42dB or more.	
9. Distortion	1) V band CH5 : 145.040MHz E,E3 CH9 : 145.940MHz K,P,M,M2,M3,E2 SSG : 40dB μ AF output : 4V/8 Ω	Distortion meter Oscilloscope Voltmeter SSG	Rear panel	EXT. SP			Check	5% or less.	
	2) U band CH4 : 435.040MHz M,M2,M3,E,E2,E3 CH4 : 445.040MHz K,P SSG : 40dB μ AF output : 4V/8 Ω							5% or less.	
10. S-meter	1) V band CH5 : 145.040MHz E,E3 CH9 : 145.940MHz K,P,M,M2,M3,E2 SSG : 17dB μ	SSG	Rear panel	ANT	TX-RX (A/4)	VR1	Set the SSG output to the point where the S-meter puts out lights by 2 dots from full lighting.		
	2) U band CH4 : 435.040MHz M,M2,M3,E,E2,E3 CH4 : 445.040MHz K,P SSG : 17dB μ								TX-RX (B/4)
	3) V,U band CH : In the above SSG : 18dB μ						Check		S-meter full lighting.
	4) SSG : OFF								S-meter lights out.
11. Squelch	1) V band CH5 : 145.040MHz E,E3 CH9 : 145.940MHz K,P,M,M2,M3,E2 SSG : OFF Turning the squelch knob, set it to a point where noise disappears.	Oscilloscope SSG	Rear panel	EXT. SP			Check	Squelch knob position 8 : 00 ~11 : 00 BUSY lights off.	
	2) SSG : -14dB μ							Squelch open. BUSY lights on.	
	3) SQL knob : Clockwise MAX							AF output disappear. BUSY lights off.	
	4) SSG : -3dB μ							Squelch open. Note : If not squelch opened, minimum 20dB NQ level is acceptable.	

TM-732A/E

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks				
		Test-equipment	Unit	Terminal	Unit	Parts	Method					
11. Squelch	5) U band CH4 : 435.040MHz M,M2,M3,E,E2,E3 CH4 : 445.040MHz K,P SSG : OFF Turning the squelch knob, set it to a point where noise disappears.	Oscilloscope SSG	Rear panel	EXT. SP			Check	Squelch knob position 8 : 00 ~ 11 : 00 BUSY lights off.				
	6) SSG : -14dBμ							Squelch open. BUSY lights on.				
	7) SQL knob : Clockwise MAX							AF output disappear. BUSY lights off.				
	8) SSG : -3dBμ							Squelch open. Note : If not squelch opened, minimum 20dB NQ level is acceptable.				
12. EXT. SP V,U band	1) Connect SPs in turn with EXT. SP terminal of each band and check, through operating VR of each band, that band output with a SP connected is switched from the internal SP to the external SP.		Rear panel	EXT. SP			Check	SP is switched from the internal SP to the external SP for each band.				
13. POWER	1) V band CH4 : 144.980MHz E,E3 CH8 : 145.980MHz K,P,M,M2,M3,E2 Transmission	Power meter Ammeter	Rear panel	ANT	TX-RX (A/4)	VR3, 4	Clockwise MAX	57W or more.				
	2) POWER : HI Transmission							VR3	53W	±4W 11.5A or less.		
	3) POWER : MID Transmission							VR4	12W	±1W		
	4) POWER : LOW Transmission							Check	3.0~8.0W			
	5) E,E3 CH2 : 144.000MHz CH15 : 145.920MHz K,P CH2 : 144.000MHz CH10 : 147.980MHz M,M2,M3,E2 CH1 : 136.000MHz CH12 : 173.980MHz POWER : HI Transmission										Check	46~59W
	6) POWER : MID Transmission										Check	10~14W
	7) POWER : LOW Transmission										Check	3.0~8.0W

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks		
		Test-equipment	Unit	Terminal	Unit	Parts	Method			
13. POWER	8) U band CH3 : 435.000MHz M,M2,M3,E,E2,E3 CH3 : 445.000MHz K,P Transmission	Power meter Ammeter	Rear panel	ANT	TX-RX (B/4)	VR203 VR204	Clockwise MAX	37W or more.		
	9) POWER : HI Transmission							VR203	35W	±3W 10A or less.
	10) POWER : MID Transmission							VR204	12W	±1W
	11) POWER : LOW Transmission								Check	3.0~8.0W
	12) M,M2,M3,E,E2,E3 CH1 : 430.000MHz CH7 : 439.980MHz K,P CH7 : 449.980MHz CH10 : 438.080MHz POWER : HI Transmission									28~42W
	13) POWER : MID Transmission									10~14W
	14) POWER : LOW Transmission									3.0~8.0W
14. DEV	1) V band CH4 : 144.980MHz E,E3 CH8 : 145.980MHz K,P,M,M2,M3,E2 1kHz/25mV E,E2,E3 AG : 1kHz/50mV K,P,M,M2,M3 Transmission	Linear detector Oscilloscope AG	Rear panel	ANT	TX-RX (A/4)	VR2	±4.4kHz (+, - with a larger value)	±200Hz		
	2) Down AG output from the above state by 20dB. (1kHz/2.5mV or 5.0mV) Transmission						Check	±2.2~3.8kHz		
	3) U band CH3 : 435.000MHz M,M2,M3,E,E2,E3 CH3 : 445.000MHz K,P AG : 1kHz/25mV E,E2,E3 AG : 1kHz/50mV K,P,M,M2,M3 Transmission						TX-RX (B/4)	VR202	+4.4kHz (+, - with a larger value)	+200Hz
	4) Down AG output from the above state by 20dB. (1kHz/2.5mV or 5.0mV) Transmission								Check	±2.2~3.8kHz
15. TONE	1) V band TONE key : ON Transmission After checked TONE key : OFF	Linear detector Oscilloscope	Rear panel	ANT			Check	±0.5~1.5kHz		
	2) U band TONE key : ON Transmission After checked TONE key : OFF									±0.5~1.5kHz

TM-732A/E

ADJUSTMENT

Item	Condition	Measurement			Adjustment			Specifications/Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
16. DTSS	1) V band POWER : OFF While pushing VFO and MHz keys, turn on POWER. Transmission After check, reset. Set a frequency memory once again.	Linear detector Oscilloscope	Rear panel	ANT			1633Hz single tone	±2.5kHz or more.
17. Spurious abnormal oscillation	1) V band E,E3 CH2 : 144.000MHz CH4 : 144.980MHz CH8 : 145.980MHz K,P,M CH2 : 144.000MHz CH8 : 145.980MHz CH10 : 147.980MHz M2,M3,E2 CH1 : 136.000MHz CH8 : 145.980MHz CH12 : 173.980MHz POWER : HI/MID/LOW Power supply : 11.7-16.0V variable Transmission	Spectrum analyzer					Check	Spurious -60dB or less. Free of abnormal oscillation.
	2) U band M,M2,M3,E,E2,E3 CH1 : 430.000MHz CH3 : 435.000MHz CH7 : 439.980MHz K,P CH1 : 440.000MHz CH3 : 445.000MHz CH7 : 449.980MHz POWER : HI/MID/LOW Power supply : 11.7-16.0V variable Transmission							Spurious -60dB or less. Free of abnormal oscillation.
18. CTCSS	1) V band CH7 : 145.440MHz Only with built-in TSU-7 model. Set TONE frequency to the same frequency between under test equipment and monitor equipment each other. (Pushing F key for 1 second or more, push TONE key.) Turning the SQL VR, set it to a point where noise disappears.	Monitor equipment					Check	Sound matching should be attainable.
	2) Change the TONE frequency, then transmit from the monitor equipment.							Squelch does not open.
19. Protection	1) V band CH8 : 145.980MHz E,E3 CH10 : 147.980MHz K,P,M,M2,M3,E2 ANT : OPEN Transmission	Ammeter					Check	12.0A or less.
	2) U band CH7 : 439.980MHz M,M2,M3,E,E2,E3 CH7 : 449.980MHz K,P ANT : OPEN Transmission							10A or less.

TSU-7 CIRCUIT DIAGRAM

TM-732A/E

SPECIFICATIONS

		144MHz Band	440MHz Band	
GENERAL	Frequency range MHz	U.S.A. and Canada	144~148	438~450
		Other market	144~148	430~440
		TM-732E	144~146	430~440
	Mode	F3E (FM)		
	Antenna impedance	50Ω		
	Operating temperature	-20°C~+60°C (-4°F~+140°F)		
	Power requirements	13.8V DC ±15% (11.7~15.8V)		
	Ground	Negative		
	Current drain	Transmit mode	Less than 11.5A	Less than 10.0A
		Receiver mode	Less than 1.2A	
Frequency stability	±10ppm			
Dimensions (W x H x D)	141 x 42 x 175 mm			
Weight	1.1kg			
TRANSMITTER	Output power	HI	50W	35W
		MID	10W	
		LOW	Approx. 5W	
	Modulation	Reactance modulation		
	Spurious radiation	Less than -60dB		
	Maximum frequency deviation	±5kHz		
	Audio distortion (at 60% modulation)	Less than 3%		
Microphone impedance	600Ω			
RECEIVER	Circuitry	Double conversion superheterodyne		
	Intermediate frequency 1st/2nd	45.05MHz/455kHz	58.525MHz/455kHz	
	Sensitivity (12dB SINAD)	Less than 0.16μV (-10dBμ)		
	Selectivity -6dB	More than 12kHz		
	Selectivity -60dB	Less than 24kHz		
	Squelch sensitivity	Less than 0.1μV (-14dBμ)		
	Output (5% distortion)	More than 2W (8Ω load)		
External speaker impedance	8Ω			

- NOTES : 1. Circuit and ratings are subject to change without notice, due to developments in technology.
 2. Recommended duty cycle : 1 minute Transmission, 3 minutes Reception.
