

Notes:

See the PCB symbol document for an explanation of all symbols on this diagram.

Board material is 1/16 inch thick double sided copper clad fibreglass.

Board dimensions are 1.30 inches x 3.85 inches or 33mm x 98mm (rounded up). Check the dimensions of the printed image and change the printing scale if required.

The above view is from the solder side and all areas containing points marked as ground connections should be infilled with ground copper and connected through to the top copper groundplane.

Except for the dotted line which is a top copper track joining the +12v points together, the rest of the top copper is a continuous ground plane with small gaps around non-ground component leads.

Through links are marked with arrow heads to join top and bottom copper together.
