Listing Messages

There are several commands for listing messages that are in the
system. The 'LTO (call)', and 'LFM (call)' ('List To' and 'List
From') and its alias commands default to the call of the user
logged into the system if no argument is given.

All List commands will only show messages addressed TO you, FROM you
or AT your station call. When the Sysop of this station declared
you as an MBO you will then automatically see ALL messages in the
system.

Messages that have been canceled will not appear on the message
list even though they may still be in the system.

The 'L', and 'LB' commands when given without arguments will list
only messages not previously listed for you. You may override this
feature by adding a number following the 'L', or 'LB'. The argument
0 will list all the messages in the category.

The 'LL n (loc)" command will list the last "n" private or NTS
messages filed. When the third parameter "loc" is given, the list
will begin with that message number. "loc" may also be the character
"B"egin, "E"nd, "O"ldest or "N"ewest. In that case the list will
begin from the selected end of the message list.

The "LLB n (loc)" command has the same function as the LL command
except that it lists Bulletins only.

NTS messages that are waiting to be delivered may be listed with
the 'NTS' command. This is the preferred way to list NTS
traffic. The 'LT' command will also list NTS traffic but
includes traffic that has already been accepted.

Read the help files named 'System Maintenance' and 'Message List
Explanation'.
