Notice

Hewlett-Packard to Agilent Technologies Transition

This manual may contain references to HP or Hewlett-Packard. Please note that Hewlett-Packard's former test and measurement, semiconductor products and chemical analysis businesses are now part of Agilent Technologies. To reduce potential confusion, the only change to product numbers and names has been in the company name prefix: where a product name/number was HP XXXX the current name/number is now Agilent XXXX. For example, model number HP8648 is now model number Agilent 8648.

The material contained in this document is provided "as is," and is subject to being changed, without notice, in future editions. Further, to the maximum extent permitted by applicable law, Agilent disclaims all warranties, either express or implied, with regard to this manual and any information contained herein, including but not limited to the implied warranties of merchantability and fitness for a particular purpose. Agilent shall not be liable for errors or for incidental or consequential damages in connection with the furnishing, use, or performance of this document or of any information contained herein. Should Agilent and the user have a separate written agreement with warranty terms covering the material in this document that conflict with these terms, the warranty terms in the separate agreement shall control.

Certification

Hewlett-Packard Company certifies that this product met its published specifications at the time of shipment from the factory. Hewlett-Packard further certifies that its calibration measurements are traceable to the United States National Institute of Standards and Technology, to the extent allowed by the Institute's calibration facility, and to the calibration facilities of other International Standards Organization members.

Warranty

This Hewlett-Packard instrument product is warranted against defects in material and workmanship for a period of one year from date of shipment. During the warranty period, Hewlett-Packard Company will, at its option, either repair or replace products which prove to be defective.

For warranty service or repair, this product must be returned to a service facility designated by HP. Buyer shall prepay shipping charges to HP and HP shall pay shipping charges to return the product to Buyer. However, Buyer shall pay all shipping charges, duties, and taxes for products returned to HP from another country.

HP warrants that its software and firmware designated by HP for use with an instrument will execute its programming instructions when properly installed on that instrument. HP does not warrant that the operation of the instrument, or software, or firmware will be uninterrupted or error-free.

Limitation of Warranty

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance.

NO OTHER WARRANTY IS EXPRESSED OR IMPLIED. HP SPECIFICALLY DISCLAIMS THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.

Exclusive Remedies

THE REMEDIES PROVIDED HEREIN ARE BUYER'S SOLE AND EXCLUSIVE REMEDIES. HP SHALL NOT BE LIABLE FOR ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, WHETHER BASED ON CONTRACT, TORT, OR ANY OTHER LEGAL THEORY.

Assistance

Product maintenance agreements and other customer assistance agreements are available for Hewlett-Packard products.

For any assistance, contact your nearest Hewlett-Packard Sales and Service Office.

Safety Symbols

The following safety symbols are used throughout this manual. Familiarize yourself with each of the symbols and its meaning before operating this instrument.

Caution

The **caution** sign denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in damage to or destruction of the instrument. Do not proceed beyond a **caution** sign until the indicated conditions are fully understood and met.

Warning

The **warning** sign denotes a hazard. It calls attention to a procedure which, if not correctly performed or adhered to, could result in injury or loss of life. Do not proceed beyond a **warning** sign until the indicated conditions are fully understood and met.

General Safety Considerations

Warning

Before this instrument is switched on, make sure it has been properly grounded through the protective conductor of the ac power cable to a socket outlet provided with protective earth contact.

Any interruption of the protective (grounding) conductor, inside or outside the instrument, or disconnection of the protective earth terminal can result in personal injury.

Warning

There are many points in the instrument which can, if contacted, cause personal injury. Be extremely careful.

Any adjustments or service procedures that require operation of the instrument with protective covers removed should be performed only by trained service personnel.

Caution

Before this instrument is switched on, make sure its primary power circuitry has been adapted to the voltage of the ac power source.

Failure to set the ac power input to the correct voltage could cause damage to the instrument when the ac power cable is plugged in.

Volume 2

A19 Second IF Amplifier through A27 10 MHz Frequency Standard	Service sheets containing circuit descriptions, troubleshooting information, replacement procedures, replaceable parts lists, parts identification, signature analysis troubleshooting diagrams, block diagrams, component locations, and schematic diagrams.
General Parts Listing	Replaceable parts information and parts identification figures.
Major Assembly and Component Locations	Major assembly and component locations.

A19 and A20

A19 Second IF Amplifier, Circuit Description

A19 Second IF Amplifier receives 301.4 MHz from A23 Second Converter, filters it, and sends the amplified signal to A20 Third Converter. The overall gain of the assembly is about 18 dB.

Amplifier (A)

The common-emitter amplifier circuit consists of Q1 for amplification and Q2 for active bias. The circuit gain is approximately 19 dB. R5, R6, and R7 form a 6 dB pad at the output of the amplifier.

301.4 MHz Bandpass Filter (B)

The 301.4 Bandpass Filter rejects the image frequency from A23A3 Second Converter. The 3 dB bandwidth of the filter is about 9 MHz. The coupling capacitance in the circuit is provided by the trace on the PC board. The 301.4 MHz output signal is sent to A20 Third Converter.

Output Amplifier (C)

The common emitter amplifier drives the third converter (A20) and provides reverse isolation. The circuit gain is approximately 17 dB.

A20 Third Converter, Circuit Description

A20 Third Converter receives 301.4 MHz from A19 Second IF Amplifier and mixes it with 280 MHz to provide the 21.4 MHz IF OUTPUT to the rear panel. It also sends 280 MHz to A21 275 MHz Phase Lock.

280 MHz Crystal Oscillator (A)

Q2 and associated circuitry form a modified Colpitts oscillator with the Surface-Acoustic-Wave Resonator Z1 in the feedback path. C3 and C4 form a capacitive voltage divider to set the feedback level. C5 and L3 provide the output path to the two buffer amplifiers.

280 MHz Buffer Amplifier 1 (D)

280 MHz Buffer Amplifier 1 isolates the signal to A21 275 MHz Phase Lock. The circuit is a common-emitter amplifier in which R6, R7 and R8 set the bias for Q5. The output of Q5 is sent through a 6 dB resistive pad to A21.

280 MHz Buffer Amplifier 2 (B)

280 MHz Buffer Amplifier 2 isolates the signal to the Balanced Mixer. R12, R13, and R14 set the bias for Q1. L6 and C12 transform the impedance to drive the LO port of U1.

Balanced Mixer (C)

The Balanced Mixer U1 mixes 301.4 MHz from A19 Second IF Amplifier with the signal from the 280 MHz Crystal Oscillator and sends the difference frequency to the 21.4 MHz Variable Gain Amplifier.

21.4 MHz Variable Gain Amplifier (E)

The 21.4 MHz Variable Gain Amplifier amplifies the signal from the Balanced Mixer and sends it to the rear panel. Q3 has a fixed gain that is set by R19. R16 through R18 and R20 set the bias of Q3. Q4, the second stage, has a variable gain determined by R21 and PIN diode CR1. The gain is varied by changing the current through CR1, which is driven by the PIN Driver.

PIN Driver (F)

The current drive for CR1 is supplied by the PIN Driver, which consists of Q6 and associated circuitry. The shaping network the emitter circuit of Q6 shapes the AMP CAL signal to provide the proper gain variation with input voltage in the second stage of the 21.4 MHz Variable Gain Amplifier.

A21

A21 275 MHz Phase Lock, Circuit Description

In A21 275 MHz Phase Lock, the signal from A18 275 MHz Phase Lock Oscillator is mixed with 280 MHz from A20 Third Converter, and the difference frequency is compared with the reference signal from A11 50 MHz Voltage-Tuned Oscillator. (Refer to the circuit description of the Pilot Third Local Oscillator.)

A21A1 275 MHz Mixer (E) (F) (G)

A21A1 275 MHz Mixer is mounted on a shielding support forming a shielding box to keep higher frequency components isolated from the phase detector circuitry. The signal from A18 275 Phase Lock Oscillator is nominally either 275 MHz or 277.5 MHz (depending on the reference frequency from A11 50 MHz Voltage-Tuned Oscillator) and is fed directly to the Mixer U6. The signal from A20 Third Converter is fixed at 280 MHz. This is filtered and attenuated before being fed to the Mixer U6. C29 acts with 50Ω input and output impedances to form a 433 MHz low-pass filter. L6, R31, and R32 attenuate the signal 20 dB. The output of the Mixer is nominally at 5 MHz or 2.5 MHz, the difference of the input frequencies, and this is filtered by the 80 MHz LPF to remove high frequency components. This filter is made up of L7, L8, C23, C24, and C25.

Low Noise Amplifier (H)

The signal from the 275 MHz Mixer is amplified by the Low Noise Amplifier. R19, R22, R23, C27, and Q2 form a circuit to actively bias Q5. Q5, R38, C8, and R21 from the first stage of amplification, and Q1, R20, R24, R25, and C10 form the second stage.

Buffer Amplifier (I)

L1, C11, and C12 form a 15 MHz low-pass filter in the Buffer Amplifier. C13 couples the signal to the limiting amplifier consisting of Q4, Q3, R15, L2, R18, R17, R16, and C14. This amplifier limits to produce output voltage levels compatible with ECL logic.

Phase Detector (A)

The Phase Detector compares the output frequency of the 275 MHz Mixer with the reference frequency from A11 50 MHz Voltage-Tuned Oscillator to generate the 275 MHz TUNE signal.

The Phase Detector is composed of dual D flip-flop U1 and NOR gate U3A. U2R1 through U2R6, R1, and R2 bias the ECL lines. C15 is a bypass capacitor. R33 ties the D inputs of the flip-flops high so that when a clock line goes high, it triggers the matching flip-flop, causing its positive output to go high and its inverted output to go low. U3A resets both flip-flops together whenever both become set.

Lock Detector (B)

Signals from the positive and inverted outputs of both flip-flops of U1 are fed to NOR gates U3B and U3C. The outputs of these gates are tied together and biased by resistor U2R4. R4 and C22 filter this to provide a signal whose voltage, whenever the loop is locked, is higher than the threshold voltage set by R5 and R6. When the loop is locked, the output of U4 goes low, turning off unlocked LED DS1. CR1 limits this low level on HUL3 to -0.6 V. Whenever the loop is unlocked, the filtered voltage from R4 and C22 is less than the threshold and voltage, and the output of U4 goes high. R7 limits the current through DS1, which lights to indicate UNLOCKED. VR2 and DS1 set the high level on HUL3 to approximately $+3.2$ V. Line HUL3 goes to A12 RF Section Interface to indicate to A15 Controller the status of the loop.

Loop Amplifier and Filters (C)

The Loop Amplifier receives signals from the Phase Detector flip-flops of U1. Signals from the positive output of one flip-flop and the negative output of the other flip-flop are filtered and summed together in the Loop Amplifier. Since opposite flip-flop polarities are summed, an error current will be produced to charge or discharge C26 if the flip-flop input signals differ in frequency or phase. R10, R11, C16, R12, R13, and C17 filter the signals to the Loop Amplifier. C21, C26, and R14 filter the summed signal. R8, R9 and C18 bias the amplifier to the center of the ECL voltage level range, approximately -1.3 V.

High and Low Clamps (D)

The High and Low Clamps limit the output of the Loop Amplifier to the range required by A18 275 MHz Phase Lock Oscillator. VR3 and VR4 form the Low Clamp and limit the low voltage to about $+4$ V. CR3 limits the low voltage to -0.6 V for transients during turn-on.

R27, Q6, R29 and R28 form the High Clamp. The upper voltage limit is set by R28. CR2 protects Q6. R39 limits the current in the 275 MHz TUNE line as it is sent to A18.

A22

A22 Frequency Control, Circuit Description

A22 Frequency Control provides tuning voltage to A11 50 MHz Voltage-Tuned Oscillator (VTO), current to A23A1 YIG-Tuned Oscillator (YTO), sweep to the selected oscillator, and bias to the YTO. It provides latching of data for A23 RF Converter, A6 YIG-Tuned Oscillator Phase Lock, and A11 50 MHz Voltage-Tuned Oscillator. It also indicates to A12 RF Section Interface an over-range of the phase lock voltage, and supplies a frequency analog voltage to A20 Third Converter.

Sweep Generator (A)

The Sweep Generator, with the Sweep Reference Voltage and the Sweep Generator Current Source, provides the sweep signal for the VTO and YTO and the horizontal display signal to the IF Section. A control line is provided so that the sweep may be stopped by A15 Controller.

The timing capacitor C16 is a stable polycarbonate capacitor which receives a constant drive current from Q11B to provide a ramp for sweeping frequency. The base-emitter voltage of Q11B sets the current. This voltage is determined by the Sweep Generator Current Source and by the output of U16A in the Sweep Reference Voltage circuit. U16A is offset and buffered by Q11A, Q9, and associated circuitry. Q11A and Q11B track thermally for temperature compensation. R90 and R92 provide gain to the op amp U16B. SLOW potentiometer R88 and FAST potentiometer R91 adjust sweep times to fit the particular characteristic curve of Q11. Q14 acts as a buffer when the sweep is stopped by the Sweep Stop Switch circuit (HSWP is low).

Q17, Q19, and associated circuitry buffer C16 and provide a usable drive for the Sweep.

Comparator U18 and associated circuitry detect the start voltage of the sweep and hold it at -5 V when Reset Switch Q21 is turned off. R103 and C31 improve the stability of the feedback loop, and CR1 prevents leakage of the charge on C16 during sweep time.

U17B and associated circuitry provide an offset sweep of 0 V to +10 V for horizontal display control to the IF Section.

Sweep Reference Voltage (B)

Voltage from Q10 is amplified to about +10 V and buffered by U16A. Q10 causes a variation in the voltage at TP15 of about 30 mV/°C to aid in temperature compensation of the Sweep Generator. R96 and R97 provide gain, and C15 is a filter. R128 isolates TP15 from external loading at U16A pin 1. (During normal operation this voltage might vary from about +9 V to about +11 V, depending on the ambient temperature.) SWP REF potentiometer R94 sets the positive input voltage to U16A.

Sweep Generator Current Source (C)

Q16, Q18, Q20, Q27, Q28, and Q29 are switches controlled by Latch U34, which is loaded by decoded address 5 (ADD 5). These transistors switch resistors to provide appropriate currents for selected sweep times. Current through Q12 (which is used for temperature compensation) causes a linear increase in the base-emitter voltage of Q11B, causing an exponential increase in sweep time. Thus, when all six transistor switches are saturated, a 10 ms sweep will result, but if Q18 is off, a $\times 10$ multiplier is added, causing a 100 ms sweep (see schematic for other multipliers).

Sweep Stop Switch (E)

A logic 0 at the base of Q26 (HSWP is low) causes Q13 to divert charging current from timing capacitor C16 to ground, stopping the sweep. DS3 provides a sweep-stop indication on the board.

Address Decoder (D)

Decoder U35 decodes the Address Bus and routes a load pulse to each of the seven locations noted on the schematic. U36 inverts LBIO for U35.

Bus Address 6 Latch (F)

Latch U31 provides latching for functions elsewhere in the RF Section of the spectrum analyzer and turns on Reset Switch Q21 in the Sweep Generator. Decoded address 6 (ADD 6) loads U31.

Sweep Attenuator (G)

U17A, U14, and U13 provide an N/1023 Attenuator to the analog SWEEP voltage, while U29, U10 and associated circuitry provide attenuations of $\times 1$, $\times .1$, and $\times .01$. U14 is a multiplying digital-to-analog converter (DAC) whose reference (pin 17) sweeps ± 5 V while its output, buffered by U13, sweeps ± 5 V $\times N/1023$, where N is the binary number at the U14 inputs. U30, U32, U33 latch data for the Sweep Attenuator and for A11 50 MHz Voltage-Tuned Oscillator. C27 narrows the bandwidth of U13 to lower noise in FM Coil Sweeps.

Sweep Select Switches (H)

U24 latches control information for U7 and U20, which gate the attenuated sweep to a specific oscillator and grounds unswept lines. The VTO SWEEP, YTO MAIN COIL SWEEP, and YTO FM COIL SWEEP are selectable.

Reference Voltages (I)

VR1 provides a voltage that is buffered and amplified by U12 and inverted by U15. These two op amp outputs provide tune reference voltages: -10.285 V YTO tuning reference and +10.285 V tuning reference. TUNE REF adjustment R17 sets these voltages. The -10.285 YTO tuning reference is tested at TP13. C6, C7, and C12 provide noise filtering.

VTO Tune DAC (J)

U25, U26, U27, and U28 latch data for digital-to-analog converters (DACs) U9 and U6. U9, buffered by U8, converts the ten most-significant bits into a voltage which coarse-tunes the VTO. U6, buffered by U5, converts the ten least-significant bits. The output of U5 is attenuated approximately 1/500 by R6 through R9. R7 LSD VTO adjusts this attenuation. The attenuated voltage is used for fine tuning. U38 sums the voltages and provides the VTO tuning voltage. This tuning voltage should range from 0 to +10.23 V as observed at TP9. TP18 is used to measure the output of U9, TP7 the output of U6.

YTO Drive Circuits

The following circuits provide control currents or bias voltages to A23A1 YIG-Tuned Oscillator: YTO Tune DAC, YTO Main Coil Tune Driver, YTO FM Coil Driver, YTO Main Coil Fixed Driver, -10 V Bias, and YTO filter.

YTO Tune DAC (K)

U4 is a 10-bit digital-to-analog converter (DAC) controlled by data latched in U22 and U23 and buffered by U3. Full scale output (adjusted by YTO potentiometer R25) should be 10.230 V between zero setting and 1023 setting at the input to U4.

YTO Main Coil Tune Driver (L)

U1 sums SWEEP and YTO TUNE through R31 and R32. It drives Darlington pair Q8 and Q7 to provide a linear voltage-to-current function across R51. CR3 and CR4 are clamps. R35 and R36 provide gain. R48, VR7, and R49 provide 0 V bias for Q8 and Q7. C24, R50, and CR8 provide startup compensation to the YTO magnet structure. STOP potentiometer R35 adjusts the stop point in YTO tuning.

YTO Main Coil Fixed Driver (N)

R34, R40, C18, and R41 provide a tuning reference voltage, U37 compares this to the voltage at the wiper of R39 START adjustment. The resulting voltage level is converted to a corresponding current by Q3 and Q4. This adjusts the start point of the YTO when the tuning DACs are set to zero.

YTO FM Coil Driver (M)

Q24 and Q25 provide a high-current voltage source for voltage-to-current conversion across FM SWP potentiometer R64 and R65 to drive the FM coil of the YTO. For spans ≥ 1 MHz and ≤ 20 MHz, the FM Coil Driver sweeps frequency. U19 drives Q24, Q25, R16, and R62 from the sweep- and phase-correction voltages summed by R30, R33 and R57, R58. C19, C20, C5, L4, and L5 filter a spurious response from the YTO phase lock loop.

–10 V Bias (P)

Differential pair Q23A and Q23B drive Q22 to provide a high-current –10 V bias to the YTO, R53 is a current source, and R55, R56 feed back the output voltage to the base of Q23B.

YTO Filter (R)

Q6 acts to switch Q5, which switches C26 and R47 across the main coil of the YTO. In FM COIL and VTO sweeps, this helps reduce open-loop noise in the YTO. VR6 and CR5 protect C26 and Q5 from inductive flyback. R45, R46, VR5 are level-shifters.

Frequency Analog Voltage (O)

AMPL CAL is a voltage to compensate for gain rolloff in the signal first converter and to set IF gain. It results from the summing of the YTO TUNE and YTO MAIN COIL SWEEP voltages with the REF LEVEL CAL voltage from the front panel. U21C is a buffer, and U21D sums the two inputs. Potentiometer R66 provides the TILT adjustment in wide spans, and CR2 provides temperature compensation for IF gains.

YTO Phase Lock Limit Indicators (Q)

The phase-correction voltage must not exceed ± 5 V for best operation, so U21A and U21B detect these limits and provide visual indications (DS1 and DS2) and logic levels to A12 RF Section Interface. VR8 and VR9 limit the positive swing of the output voltage, while CR6 and CR7 limit the negative swing.

A22 Frequency Control, Troubleshooting

The A22 Frequency Control assembly generates the sweep ramp and tune voltages used by the swept oscillators in the analyzer. A key element in this operation is the 10-bit DAC. At the end of this troubleshooting information is a short theory on 10-bit DACs. Verification of most functional blocks on this assembly can be made without removing it from the instrument.

Sweep Generator

Operation of the Sweep Generator can be checked with the KSF (**SHIFT** **RES BW**) function. Using sweep times of 20 ms, 30 ms 50 ms, 100 ms, 1 s and 100 s and KSF, the Sweep Generator Current Source (C) circuitry is exercised. The sweep time is 10 ms times the multiplier value for each switch that is off. The 100 s measurement may show a reading such as 8 s. The internal counter resets to zero at 100 s. Thus, the proper reading would be 108 s.

Figure 1 shows the waveforms in the Sweep Generator. The sweep ramp is generated in the following manner. Initially, C16 is charged to -5 V and Q21 is on. Current from Q11B charges C16 until it reaches +5 V. It is held at this level because HSWP goes low. The reset pulse turns Q21 off, causing U18 pin 6 to go negative, forward-biasing CR1 and discharging C16 to -5 V (for example, until U18 pin 6 reaches +3.11 V). When HSWP goes high, a new sweep is started. LED DS3 is on when the sweep is stopped.

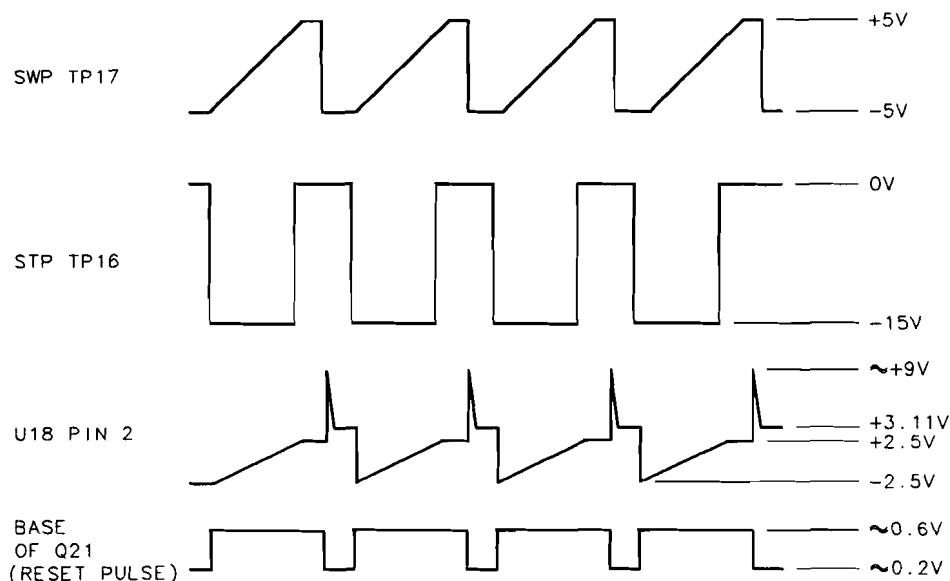

Figure 1. A22 Sweep Generator Waveforms

Table 1 is a truth table showing the states of the Sweep Generator Current Source transistors for sweep times from 20 milliseconds to 1500 seconds.

Table 1. Sweep Generator Current Source Truth Table

Sweep Time	Q16	Q18	Q20	Q27	Q28	Q29
milliseconds

1500	OFF	OFF	OFF	OFF	OFF	OFF

Sweep Attenuator

The Sweep Attenuator is a 10-bit DAC whose reference voltage is swept from -5 V to $+5\text{ V}$. U13 pin 6 is the $\pm 5\text{ V}$ sweep times $N/1024$, where N is supplied by the processor. This output is multiplied by 1, 0.1, or 0.01 as shown in Table 2, depending on the frequency span.

Table 2. Sweep Attenuator Multipliers versus Frequency Spans

Frequency Span	X1 (U29B)	X0.1(U29A)	X0.01 (U29C)
Span > 170 MHz	ON		
20 MHz < Span \leq 170 MHz		ON	
2 MHz < Span \leq 20 MHz	ON		
1 MHz < Span \leq 2 MHz		ON	
50 kHz < Span \leq 1 MHz	ON		
5 kHz < Span \leq 50 kHz		ON	
Span \leq 5 kHz			ON

Each time a new multiplier is switched in, the output at U13 pin 6 will be the full ± 5 V sweep ramp.

This attenuated sweep is routed to the appropriate sweep circuit depending on the frequency span, as shown in Table 3.

Table 3. Sweep Circuit vs Frequency Spans

Frequency Span	Sweep Circuit
Spans > 20 MHz	YTO Main Coil
1 MHz < Span \leq 20 MHz	YTO FM Coil
Span \leq 1 MHz	50 MHz VTO

Due to a rounding error in the processor, the switching points of 20 MHz and 1 MHz are not exact when using the RPG to set the frequency Span.

All lines are grounded when not used. The YTO is being phase locked during the 0 V time period that occurs on the voltages at TP10, TP8, TP5, and TP4.

Operation of the Sweep Attenuator DAC can be verified by using [SHIFT] [CF STEP SIZE] (KSJ). Measure the voltage at TP10. Set the analyzer to [SINGLE] Sweep, [EXT] Trigger. Key in KSJ and 0 GHz. Press the DATA [\uparrow] key repeatedly. The voltage at TP10 should start at approximately 0 V and double with each step to -5 V. If [LINE] Trigger is used, it will step +5 V. It is good procedure to use the DATA keys when checking the various DACs. This way, each bit is checked for operation.

FROM SHEET 1

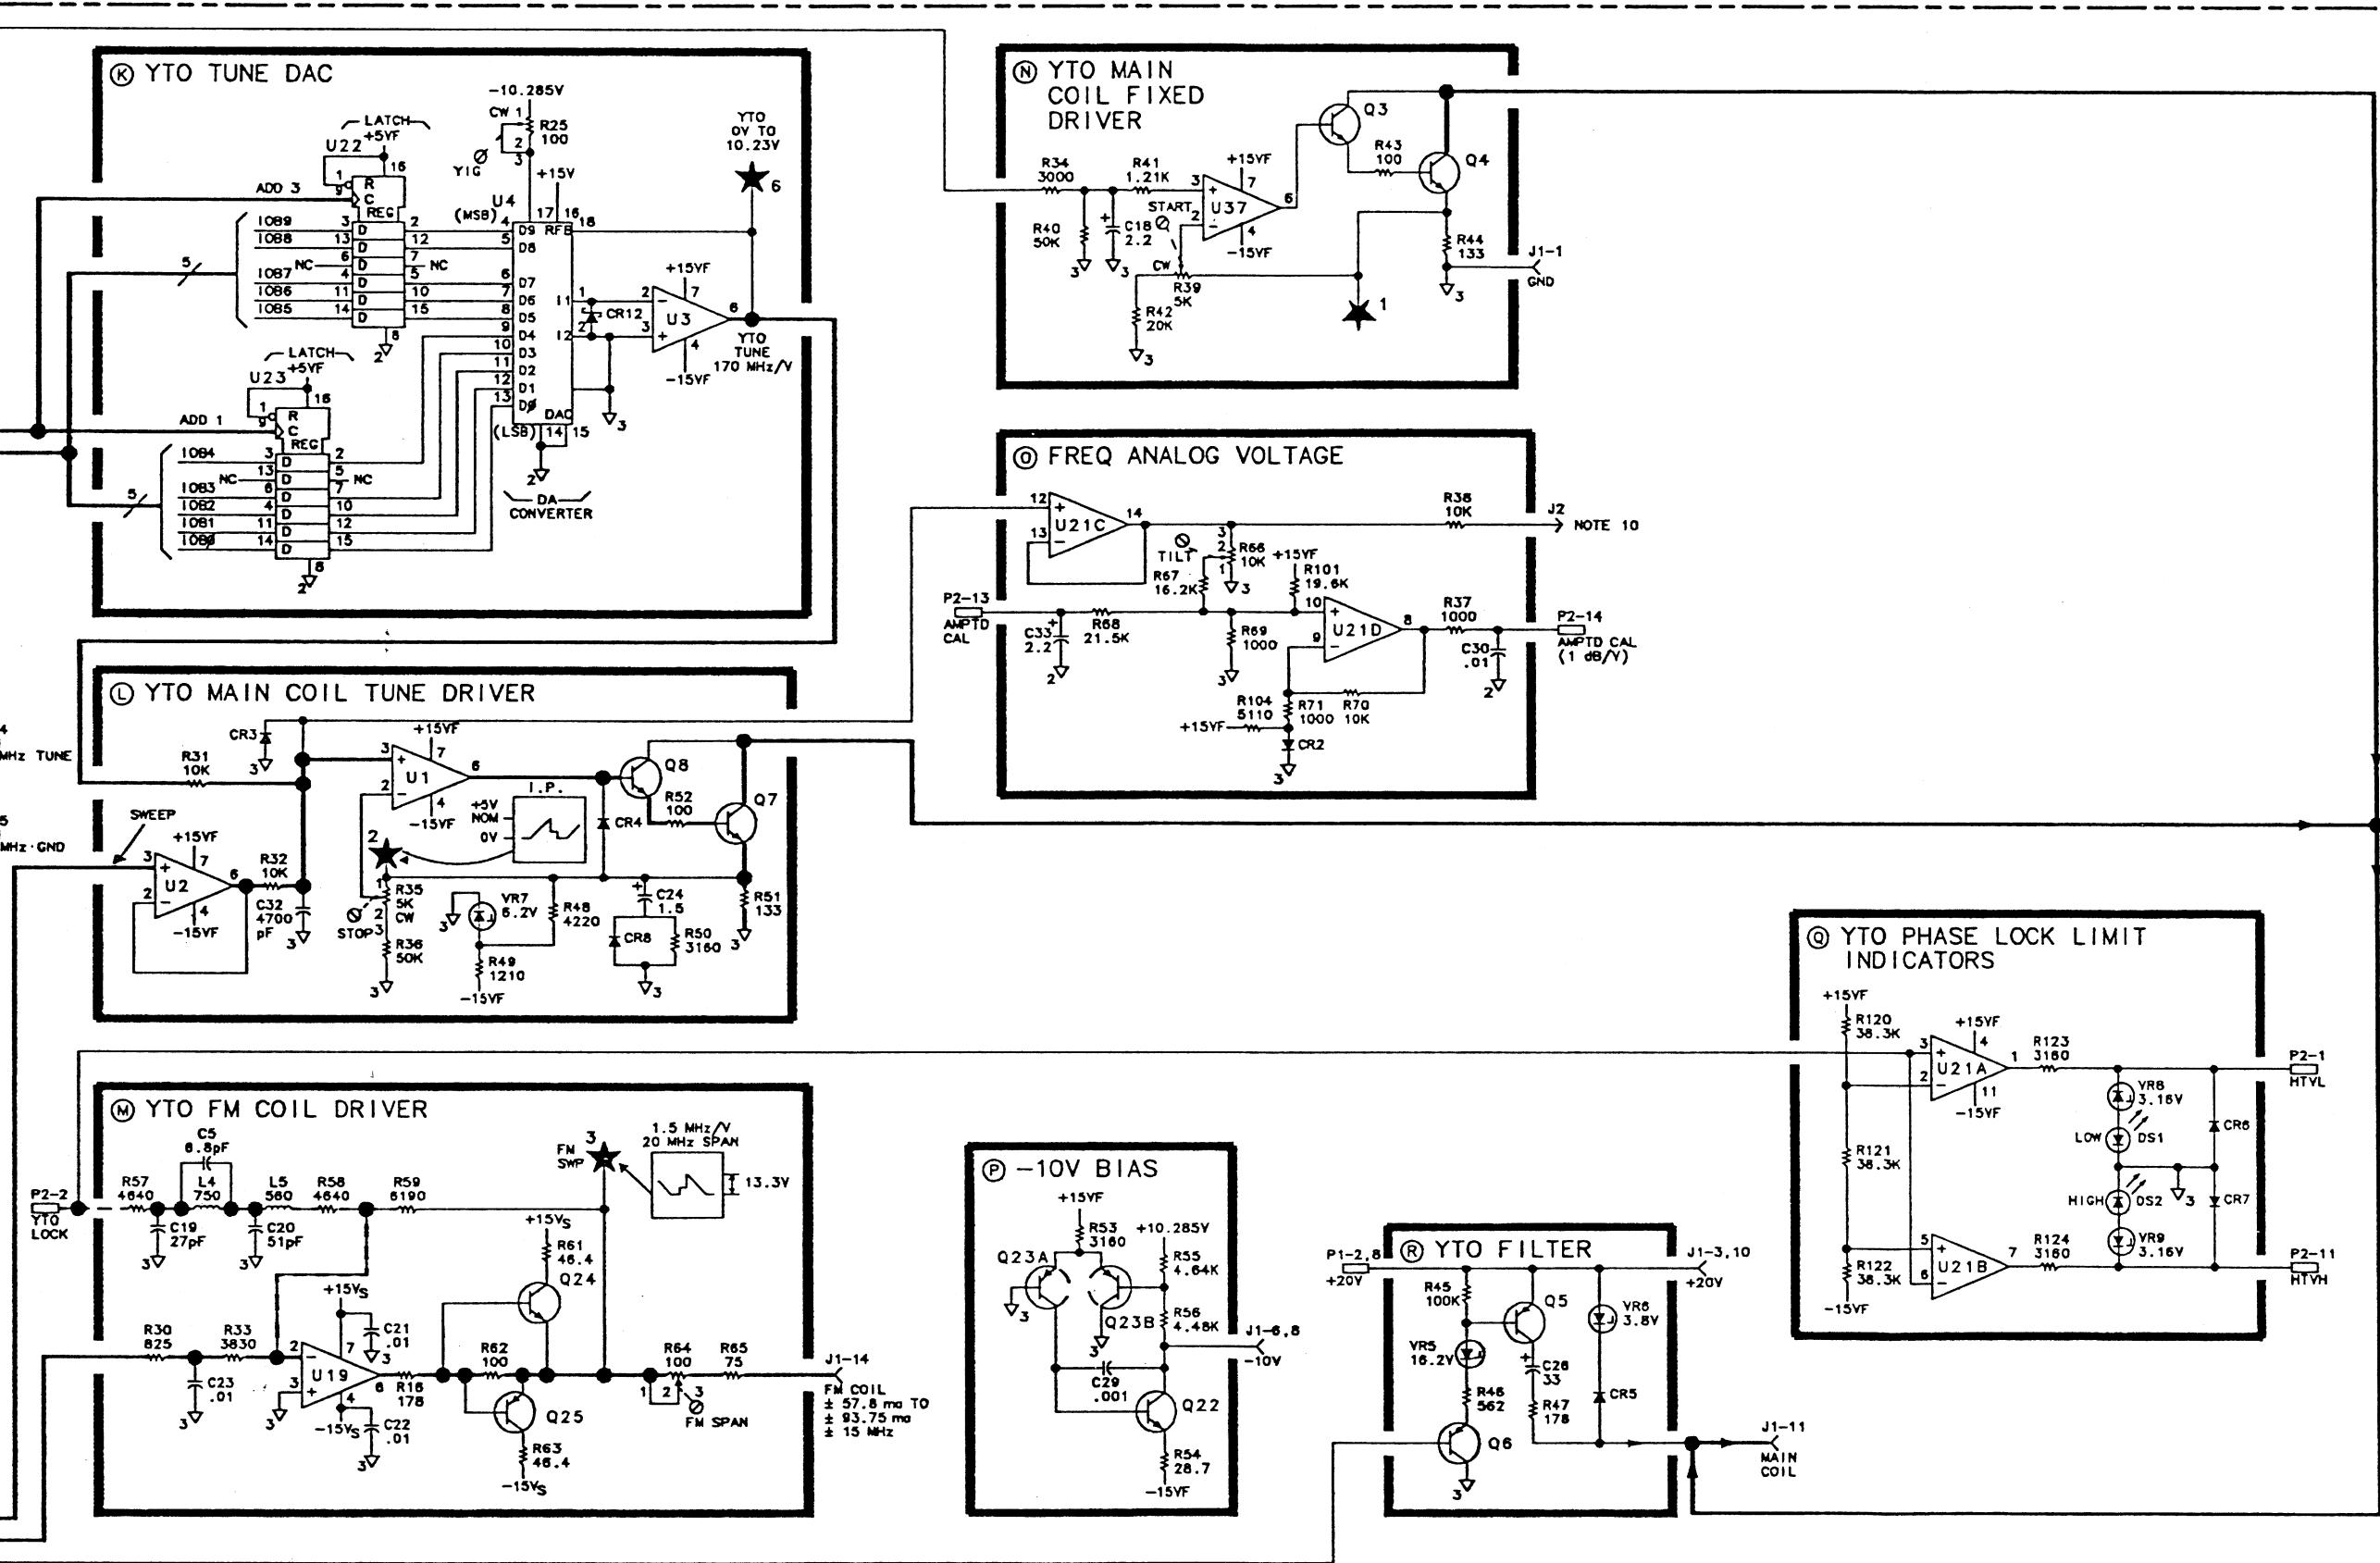

NOTES:

1. REFERENCE DESIGNATORS WITHIN THIS ASSEMBLY ARE ABBREVIATED. FOR COMPLETE REFERENCE DESIGNATOR, ADD ASSEMBLY PREFIX TO THE ASSEMBLY DESIGNATION.
2. UNLESS OTHERWISE INDICATED: RESISTANCE IS IN OHMS (Ω) CAPACITANCE IS IN MICROFARADS (μF) INDUCTANCE IS IN MICROHENRIES (μH)
3. TEST VOLTAGES ASSUME INSTRUMENT PRESET (I.P.) CONDITION UNLESS NOTED.
4. MNEMONIC TABLE:

MNEMONIC	DESCRIPTION
HTYL	HIGH-TUNE VOLTAGE LOW
HTYH	HIGH-TUNE VOLTAGE HIGH
LLOH	LOW INDICATES 2ND LO SHIFTED HIGH (1753.6 MHz)
HDIY	HIGH-TURN ON - 2 ON A11 50 MHz VTO
LHLD	LOW HOLD PHASE LOCK VOLTAGE ON A6 YTO PHASE LOCK
LOVTO	LOW OUTPUT YTO
HOVTO	HIGH OUTPUT VTO
HFLT	HIGH TURN ON FILTER ON A11, 50 MHz VTO
HWBW	HIGH WIDE YTO LOOP BW (100 kHz) A6 YTO PHASE LOCK
HGND	HIGH GROUND OUTPUT OF PHASE DET., A6 YTO PHASE LOCK
HSWP	HIGH SWEEPING
IOPB-15	INST. BUS DATA BITS #15
ADR#-4	INST. BUS ADDRESS BITS #4
ADD#-7	DECODED ADDRESS BUS BITS #7
LB10	LOW BOTTOM BOX I/O STROBE

5. U7, 20 AND 29 ARE QUAD JFET ANALOG SWITCHES. THE SWITCHES IN U7 AND U29 ARE CLOSED WHEN THEIR CONTROL INPUTS (PINS 1, 8, 9, AND 18) ARE HIGH. U20A AND U20B ARE CLOSED WHEN THEIR CONTROL INPUTS ARE HIGH; U20B AND U20D ARE OPEN WHEN THEIR CONTROL INPUTS ARE HIGH. CLOSED RESISTANCE FROM INPUT TO OUTPUT IS TYPICALLY 150–200 OHMS.
6. UNLESS OTHERWISE INDICATED, LOGIC LEVELS ARE TTL:
2V TO +5.0V = LOGIC '1' = HIGH
0V TO +0.8V = LOGIC '0' = LOW
7. U38A, B, C ARE NOT USED; INPUT PINS MAY BE TIED TO GND.
8. U7D NOT USED: INPUT PINS 6, 7, 8 NO CONNECTION.
9. UNLESS OTHERWISE INDICATED: SIGNALS ENTER AT LEFT SIDE AND EXIT AT RIGHT SIDE OF FUNCTION BLOCKS.
10. CONNECTOR FOR J2 IS NOT INSTALLED.

A23

A23 RF Converter, Circuit Description

A23 RF Converter has two conversion paths. In the first, the signal from the RF Attenuator in A5 Front Panel is mixed with a signal from A23A4 First LO Distribution in A23A2 First Converter. The output is filtered, converted by A23A3 Second Converter, and the 301.4 MHz output delivered to A19 Second IF Amplifier.

The second conversion path starts with A23A6 Comb Generator. This assembly takes 20 MHz from A16 20 MHz Reference and forms a pulse containing the harmonics of 20 MHz. This pilot signal is applied to A23A5 Pilot First Converter, which mixes power from A23A4 First LO Distribution with the pilot signal. The output is filtered, down-converted by A23A3 Second Converter, and sent to A9 Pilot Second IF Amplifier.

A23A4 First LO Distribution takes power from A23A1 YIG-Tuned Oscillator and splits and amplifies it for delivery to A23A2 First Converter, A23A5 Pilot First Converter, and the auxiliary 1ST LO OUT on the rear panel. This assembly also contains the bias circuitry for A23A3 Second Converter and A23A6 Comb Generator.

Reference designations in this circuit description are abbreviated. For the full reference designation, add the prefix of the assembly or subassembly in which it is located. For example, Q1 in A23A3A2 Second LO is actually A23A3A2Q1.

A23A2 First Converter

The input signal from A5 Front Panel travels through the 1700 MHz Low-Pass Filter that is formed by a series of traces on the printed circuit board. The diodes in U1 form a balanced mixer. The first LO signal from A23A4 First LO Distribution is attenuated by A23T2 and then fed to the diodes through a balun. One diode is fed from the center conductor; the other, from the shield. Thus the diodes are driven 180 degrees out of phase. The signal from the 1700 MHz Low-Pass Filter travels through the alternately-conducting diodes, mixing with the LO signal from A23A4. The resulting IF signal is fed through a split-output line that is covered by a small block of polyiron to improve the mixer balance and to absorb some of the unwanted higher-order mixing products. The 6 dB pad (R1, R2, and R3) provides a frequency-independent termination for the mixer. The output from the pad is fed through the 5 GHz Low-Pass Filter which further attenuates the unwanted mixing products. This filter is also formed by printed circuit board traces. The output from the filter is the first IF out.

A23T2 Attenuator

A23T2, a 2 dB attenuator, minimizes the interaction between the First Converter and the A23A4A3 LO FET Amplifier.

A23A5 Pilot First Converter

A23A5 Pilot First Converter is identical to A23A2 First Converter except that the pad is 2 dB instead of 6 dB.

A23A6 Comb Generator

A23A6 Comb Generator consists of a 20 MHz comb generator and equalization circuitry. The combs are generated by the step recovery diode CR1. A 20 MHz signal from A16 20 MHz Reference is applied to a high-pass filter formed by L1 and C1. C2 and L1 match the impedance of the input to the impedance of CR1. Forward bias is applied to the diode through R4 and L4. When the 20 MHz driving signal is in the positive part of its cycle, CR1 conducts and stores a charge determined by the amount of drive power and the magnitude of the bias. When the drive goes negative, the charge is removed from the diode until all the charge that was stored during the positive part of the cycle (less recombination losses) is gone. Then the voltage across the diode abruptly changes, and a current pulse (generated in the loop formed by L3, C3, and CR1) causes a large, very narrow, negative-going pulse to be generated across CR1. This pulse is equalized in the frequency domain by the bridged pad formed by R1, R2, C4, C5, and the printed circuit board transmission line. R5 through R7 form a 12 dB pad for the proper output level. The comb is then available to A23A5 Pilot First Converter.

A23A4 First LO Distribution

A23A4 First LO Distribution consists of A23A4A1 Coupler/Splitter, A23A4A2 RF Converter Bias, A23A4A3 First LO Amplifier, and A23A4A4 Pilot First LO Amplifier.

A23A4A1 Coupler/Splitter. Power from A23A1 YIG-Tuned Oscillator is applied to A23A4A1 Coupler/Splitter. This power is propagated through a directional coupler which couples power to A23A4A3 First LO Amplifier. The directional coupler is formed by printed circuit board traces with R1 and R2 forming the termination for the coupled portion of the signal. The main power component travels through the directional coupler in a 3 dB power splitter (formed by printed circuit board traces and R3 and R4) which provides isolation between J4 and J3. One output of the splitter goes ultimately to the rear panel auxiliary 1ST LO OUT. The other input goes through a 6 dB pad (R5, R6, and R7) to A23A4A4 Pilot First LO Amplifier.

A23A4A4 Pilot First LO Amplifier. This amplifier boosts the LO drive by a nominal 10 dB, and its output drives A23A5 Pilot First Converter.

A23A4A3 First LO Amplifier. The power from the directional coupler is applied to A23A4A3 First LO Amplifier. This amplifier, identical to A23A4A4 Pilot First LO Amplifier, provides an LO signal to A23A2 First Converter.

A23A4A2 RF Converter Bias. This assembly contains the circuitry to bias A23A6 Comb Generator, A23A3 Second Converter, A23A4A3 First LO Amplifier, and A23A4A4 Pilot First LO Amplifier. Transistor Q1, with its associated circuitry, forms a variable current source to bias A23A6 Comb Generator. R4 and R5 form a voltage divider to fix the base voltage and

hence the emitter voltage of Q1. The value of R6 determines the amount of emitter current flow. C2 provides low frequency filtering. E1, VR1, and C5 form a transient limiting network to protect the First LO Amplifier and the Pilot First LO Amplifier, which are easily rendered inoperative by small transients (>5.1 V) on their power leads. R8, R9, and C7 provide filtered negative bias for A23A3A2 Second LO. Transistor Q2, with its associated circuitry, drives shift diode CR3 in A23A3 Second Converter. When the LLOH line from A22 Frequency Control is high, Q2 does not conduct, and -15 V is present at its collector, back-biasing the shift diode in A23A3 Second Converter. When LLOH goes low, Q2 becomes a current source, forward biasing the shift diode and illuminating DS1 to indicate that the Second LO is in its high frequency state.

A23A3 Second Converter

A23A3 Second Converter consists of a first IF filter, pilot first IF filter, second mixer, pilot second mixer, and the following subassemblies: A23A3A1 Pilot Second LO Buffer, A23A3A2 Second LO, and A23A3A3 Second LO Buffer.

A23A3A2 Second LO. A23A3A2 Second LO is actually composed of Q1 on the printed circuit board A23A3A2 and the second LO cavity Z9. R1 and R2 provide bias for Q1. The inductance and capacitance of the printed circuit board traces make Q1 unstable enough to oscillate. The cavity Z9 determines the frequency of that oscillation. The frequency of Z9 can be changed by forward biasing CR3, which effectively shorts out a small part of the cavity, making its frequency higher.

A23A3A3 Second LO Buffer. A probe inserted into Z9 couples power into A23A3A3 Second LO Buffer. The printed circuit board transmission lines serve to match the cavity impedances to those of Q1. C3 provides an ac ground for one of the lines. Q2 and R1 provide bias for Q1. The output of this amplifier drives the second mixer cavity Z4.

A23A3A1 Pilot Second LO Buffer. A23A3A1 Pilot Second LO Buffer works in the same way as A23A3A3 Second LO Buffer, except that the output drives the pilot second mixer cavity Z8.

First IF. The 2050 MHz (or 2055 MHz, depending on the state of the Second LO) first IF signal is applied through J1 to the three-pole 2052.5 MHz Bandpass Filter. The resonant frequencies of the cavities Z1, Z2, and Z3 determine the shape and frequency of the filter output signal. The filter output is coupled to the second mixer diode CR1, where it is mixed with power from A23A3A3 Second LO Buffer. The resulting second IF, 301.4 MHz, goes into the Matching Filter (C6, C7, and L2), which matches the impedance of CR1 to 50Ω . L1 and R1 provide a dc return for the diode.

Pilot First IF. The pilot first IF is applied through J2 to the 2017.6 MHz Bandpass Filter composed of Z5, Z6, and Z7. The output of the filter is coupled into the pilot second mixer diode CR2, where it is mixed with power from A23A3A1 Pilot Second LO Buffer. The resulting pilot second IF, 269 (± 10) MHz goes into the Matching Filter (C8, C9, and L4) which matches the impedance of CR2 to 50Ω . L3 and R2 provide a dc return for the diode. C10, C11, and L5 form a 450 MHz low-pass filter.

A23 RF Converter Removal and Installation

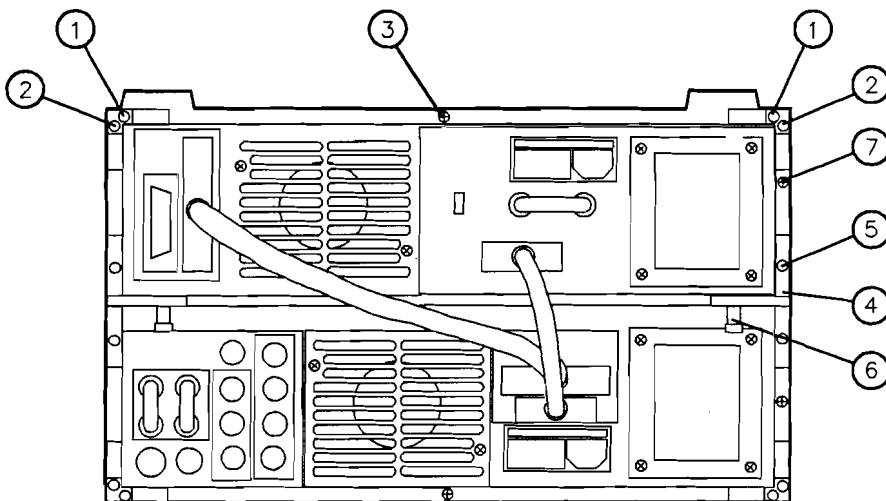

Figure 1. A23 RF Converter Removal and Installation

Removal

Warning

Remove ac line cord from both instruments before proceeding with this procedure.

1. Position instrument upside down. Remove feet ① by removing screws ② as shown in Figure 1.
2. Remove cover from bottom of RF Section (now on top of instrument) by loosening pozi-drive screw ③.
3. Remove foot ④ indicated in Figure 1 from rear of instrument by first removing screw ⑤, then loosening thumbscrew ⑥.
4. Remove RF Section right side cover by loosening pozi-drive screw ⑦.
5. Remove four pozi-drive screws from RF Section right side frame used to attach RF Converter to side frame. Location of these screws is indicated on top of RF Converter Assembly.
6. Remove two straight-slot screws, (location indicated on top of RF Converter assembly), used to attach RF Converter to Motherboard.
7. Position instrument on its right side.
8. Slide RF Converter out of instrument slowly being careful not to pinch or bind cables.
9. If removing RF Converter for adjustment, turn Converter upside- down so that Second Converter adjustments are facing upwards.
10. If removing RF Converter for repair or replacement, disconnect all cables from the Converter: 80 (gray/black) cable from A23A3J6, 92 (white/red) cable from A23A3J5, 7

(violet) cable from A23A6J1, RF input cable from Limiter, 90 (white/black) cable from A23A4A1J4 and two ribbon cables; one from the YTO A23A1 and the other from the RF Converter Bias assembly A23A4A2. (Note position in which ribbon cables are connected for reference when reinstalling RF Converter.)

Installation

Warning	Remove ac line cord from both instruments before proceeding with this procedure.
----------------	---

1. Position instrument on right side.
2. Place RF Converter next to instrument and connect cables if necessary: 80 (gray/black) cable to A23A3J6, 92 (white/red) cable to A23A3J5, 7 (violet) cable to A23A6J1, 90 (white/black) cable to A23A4A1J4, ribbon cable from A22 Frequency Control to A23A1 YTO, and ribbon cable from Motherboard to A23A4A2 RF Converter Bias assembly.
3. Position RF Converter so that A23A3 Second Converter is facing downwards.
4. Slide RF Converter into instrument being careful not to pinch or bind cables.
5. Insert straight-slot screws (location indicated on top of RF Converter assembly) into threaded holes in Motherboard and screw in slightly. Do not tighten these screws yet.
6. Position instrument upside-down.
7. Replace four pozi-drive screws to the RF Section side frame (location indicated on top of RF Converter assembly) and tighten.
8. Tighten two straight-slot screws installed in Step 5.
9. Replace RF Section right-side cover and tighten screw ⑦ shown in Figure 1.
10. Replace foot ④ and tighten screw ⑤.
11. Install and tighten thumbscrew ⑥.
12. Replace cover on bottom of RF Section and tighten screw ③.
13. Replace feet ① and tighten screws ②.
14. Position instrument upright.

A23 RF CONVERTER

85680-60054

(SERIAL PREFIX: 2408A)

- NOTES:**
- REFERENCE DESIGNATORS WITHIN THIS ASSEMBLY ARE ABBREVIATED. FOR COMPLETE REFERENCE DESIGNATION, PREFIX ABBREVIATION WITH ASSEMBLY DESIGNATION.
 - UNLESS OTHERWISE INDICATED: RESISTANCE IS IN OHMS (Ω) CAPACITANCE IS IN MICROFARADS (μF) INDUCTANCE IS IN MICROHENRIES (μH)
 - TRANSMISSION LINES ARE SHOWN AS INDICATED BELOW:
TL
 - SIGNAL LEVELS ARE MEASURED WITH -10 dBm SIGNAL APPLIED TO A2J3.
 - MNEMONIC TABLE:

MNEMONIC	DESCRIPTION
LLOH	LOW PLACES SECOND LO IN HIGH FREQUENCY STATE

 - L AND C PART OF PC BOARD.
 - UNLESS OTHERWISE INDICATED: SIGNALS ENTER AT LEFT SIDE OR TOP AND EXIT AT RIGHT SIDE OR BOTTOM OF FUNCTION BLOCKS.
 - FILTER IS PART OF CABLE.
 - POWER MEASUREMENTS ARE TAKEN WITH A SPECTRUM ANALYZER USING A HIGH IMPEDANCE PROBE.
 - A23A6R5+ AND A26A6R7+ ARE FACTORY-SELECTED COMPONENTS. ACCEPTABLE VALUES RANGE BETWEEN 56.29 AND 82.52.
 - A23A6R6+ IS A FACTORY-SELECTED COMPONENT. ACCEPTABLE VALUES RANGE BETWEEN 147Ω AND 216Ω.
 - A23AT2 WAS USED ONLY BETWEEN SERIAL PREFIXES 2408A AND 2636A.

A 23

A24

A24 Voltage Regulator, Circuit Description

A24 Voltage Regulator provides +20 V, +15 V, +5 V, -15 V, and -5.2 V regulated voltages to the RF Section. It also provides overvoltage protection, provides for thermal shutdown at temperatures above 85°C, controls fan operation, and ensures power-up and power-down operation that will not invalidate date in the A15 Controller. The A24 Voltage Regulator also controls power to the oscillator and the oven in the A27 10 MHz Frequency Standard of the standard HP 85680B, or to the oscillator in the A14 TCXO Buffer of the HP 85670A and the HP 85680B Options H44 and H96.

Voltage Regulator Control (A)

When the front-panel LINE switch is in STANDBY, the STBY SW line is grounded, the Fan Relay on the Motherboard is energized through CR1, and the fan is turned off.

When the STBY SW line is grounded, Q7 is turned on through CR2, and Q5 is turned on, shutting off the current source to the -15 V REG circuit. In the same manner, Q3 is turned on, which turns off the +20 V REG circuit. When these two supplies are turned off, the remaining regulated supplies are also shut off.

When the operating temperature exceeds 85°C, the THERMISTOR lines are activated through thermistor A26RT1, unbalancing the bridge on the input of op amp U1. U1 senses the unbalance and drives Q8 to saturation, shutting off the regulated power supplies. TEMP indicator DS1 lights to indicate thermal shutdown.

+20 V REG (D)

Q1 through Q3 and associated circuitry are a current source that drives the Darlington pair A26Q2B and A26Q2E on the Motherboard (see Figure 2). Q10 and associated circuitry are a Foldback Current Limit that monitors both sides of current sense resistor A26R9.

Q9, with its associated circuitry, forms a crowbar circuit. An overvoltage shorts the supply through Q9, which turns on the current limit transistor Q10. CR17 is a reverse protection diode that prohibits the voltage from being pulled negative, since the crowbar circuit protects against positive overvoltage only. DS2 is then +20 V indicator LED on the board.

VR5 provides a voltage reference for the positive input of op amp U2. The divided +20 V sense voltage is the negative input. The +20 V ADJ potentiometer R60 adjusts the regulated voltage of the circuit. (The other regulator circuits are referenced from +20 V REG, so if R60 is adjusted for +20 V, the other regulated voltages will also be within tolerance.) VR3 and VR4 assure proper operating conditions for op amp U2 when the instrument is in STANDBY.

–15 V REG, –5.2 V REG, +5 V REG and +15 V REG (C) (F) (G) (H)

These circuits are similar in operation to that of +20 V REG.

Power Up (E)

The Power Up circuit is designed to provide the HPUP signal to the A15 Controller only after all regulated supplies are operating at correct voltages. If line power is lost, or if the front-panel LINE switch is placed in STANDBY, HPUP is deactivated before the supply voltages fall below operating levels.

If line power is removed from the instrument, the voltage at the output of U7B is momentarily driven low and unbalances comparator U7A through CR22 to deactivate the HPUP line. If the LINE switch is placed in STANDBY, U7A is unbalanced through CR21. The short RC time constant provided by R90 and C11 provides enough time for the HPUP line to go low before power is removed.

When the LINE switch is placed ON, or when line power is restored, C11 slowly charges because of the long RC time constant provided by R96. Thus, all regulated supplies have time to reach their operating voltages before the HPUP line goes high.

Frequency Reference Supply and Control (B)

Standard HP 85680B

This circuit controls the oven and oscillator power in the A27 10 MHz Frequency Standard, signals A23 RF Section Interface when the oven is cold, and provides a front-panel LED indication when the LINE switch is in STANDBY. The circuit is designed so that oscillator power is removed but oven power remains on when the instrument is in STANDBY. Oscillator power is also removed when an external time base is used.

When the LINE switch is ON, +20 V provides oven power (OVN PWR). When the LINE switch is in STANDBY, the unregulated +25 V provides oven power through diodes CR4 through CR7, and Q19, but +20 V is removed from Q23, and the oscillator power is turned off.

When an external time base is used, the HINT line goes low, turning off Q22 and Q23 to remove oscillator power.

The oven monitor (OVN MTR) line from A27 10 MHz Frequency Standard keeps comparator U8 balanced when the oven is at operating temperature. If the oven is cold, U8 drives the HOVC lines high, signaling A12 RF Section Interface.

When the LINE switch is in STANDBY, –15 V is removed from the base of Q21. Q21 turns on, sending the STBY LED signal to the front panel to run on the STANDBY indicator LED. If the instrument has line power but the regulated power is off, the STANDBY indicator is lit.

Zener diode VR1 allows proper operation of the circuit when cable W2 is disconnected from the panel.

HP 85670A and HP 85680B Option H44 and H96

This circuit controls the oscillator power in the A14 TCXO Buffer and provides a front-panel LED indication when the LINE switch is in STANDBY. The circuit is designed so that

oscillator power is removed when the instrument is in STANDBY, or when an external time base is used.

When the LINE switch is ON, Q23 is turned on to provide oscillator power (OSC PWR). When the LINE switch is in STANDBY, +20 V is removed from Q23, and the oscillator power is turned off.

When an external time base is used, the HINT line goes low, turning off Q22 and Q23 to remove oscillator power.

When the LINE switch is in STANDBY, -15 V is removed from the base of Q21. Q21 turns on, sending the STBY LED signal to the front panel to run on the STANDBY indicator LED. If the instrument has line power but the regulated power is off, the STANDBY indicator is lit.

Zener diode VR1 allows proper operation of the circuit when cable W2 is disconnected from the panel.

(A) VOLTAGE REGULATOR CONTROL

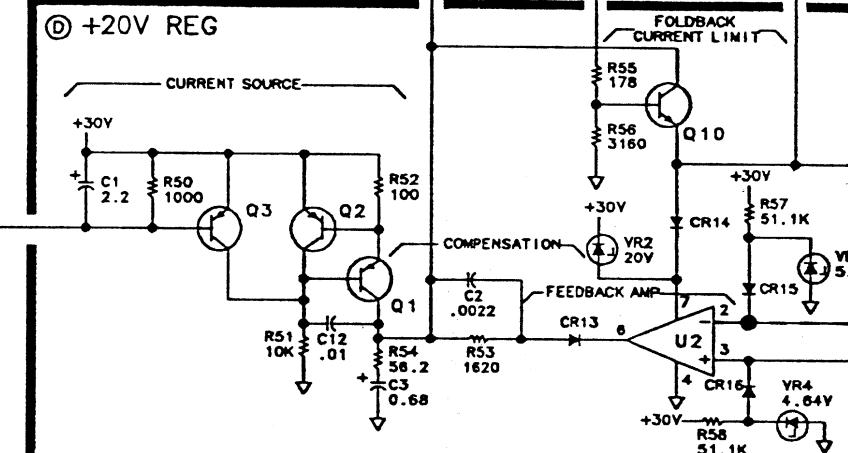

(B) FREQUENCY REFERENCE SUPPLY AND CONTROL

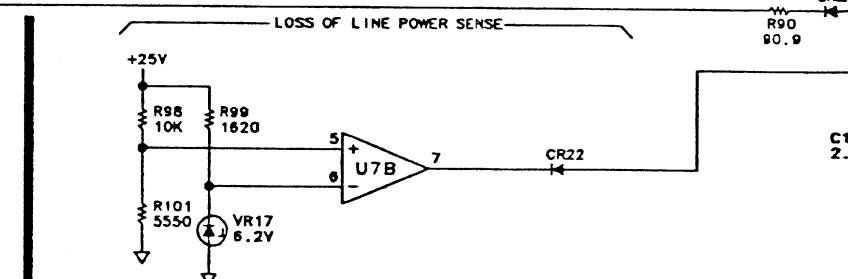

(C) -15V REG

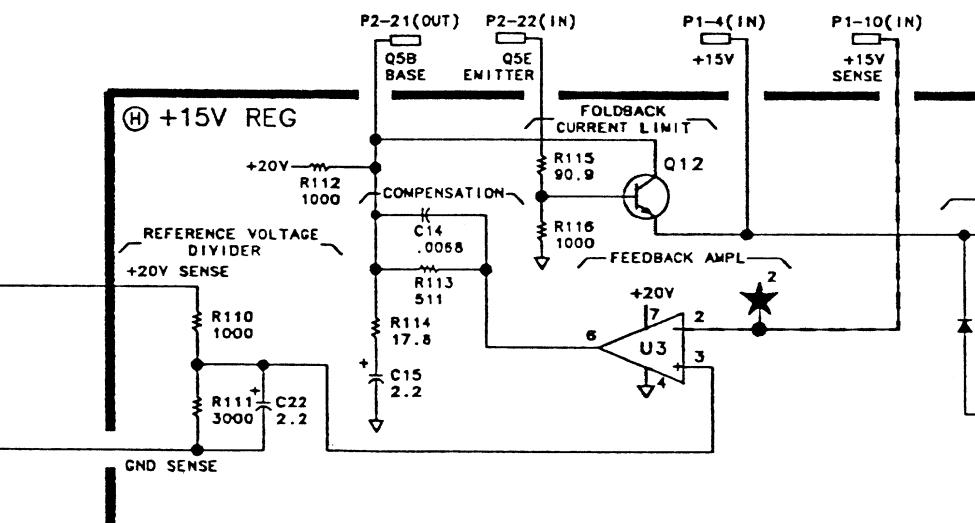

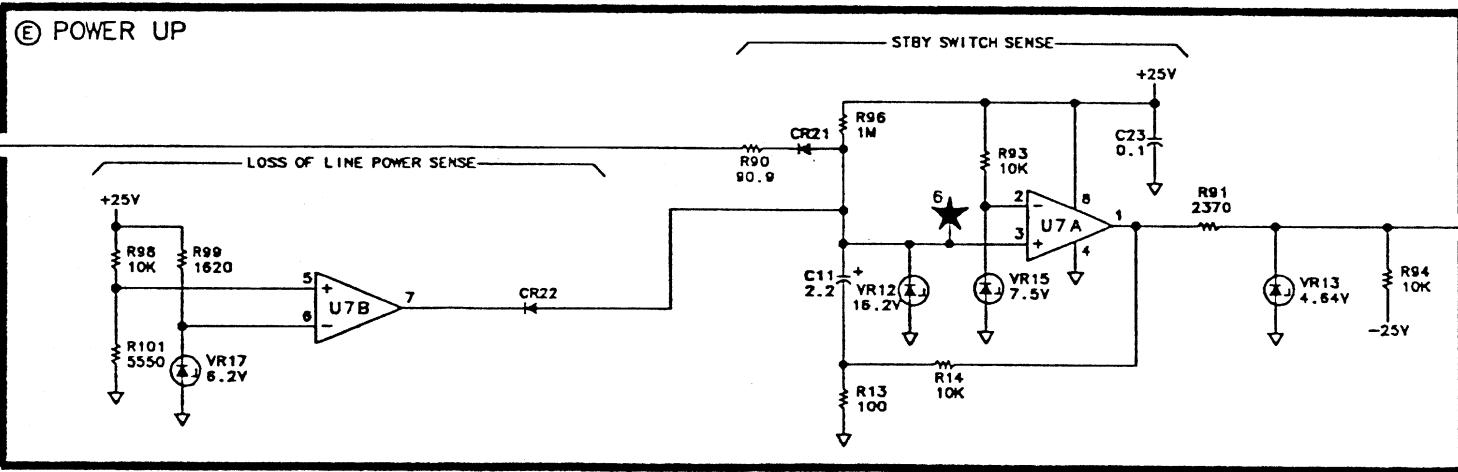

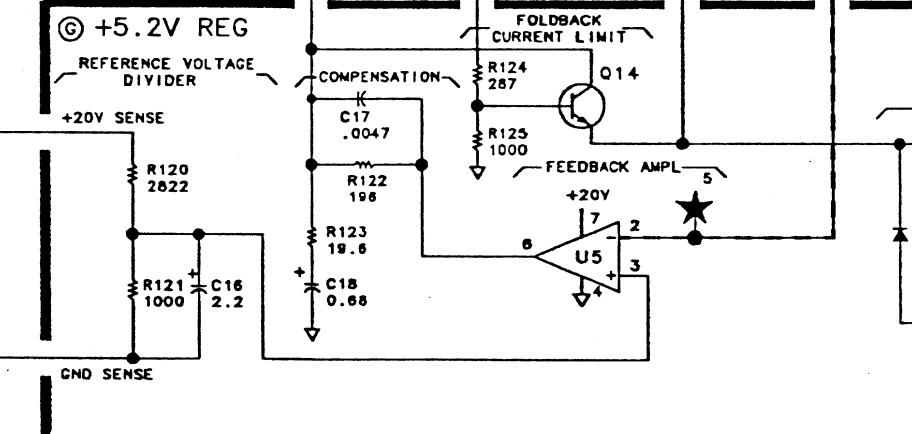

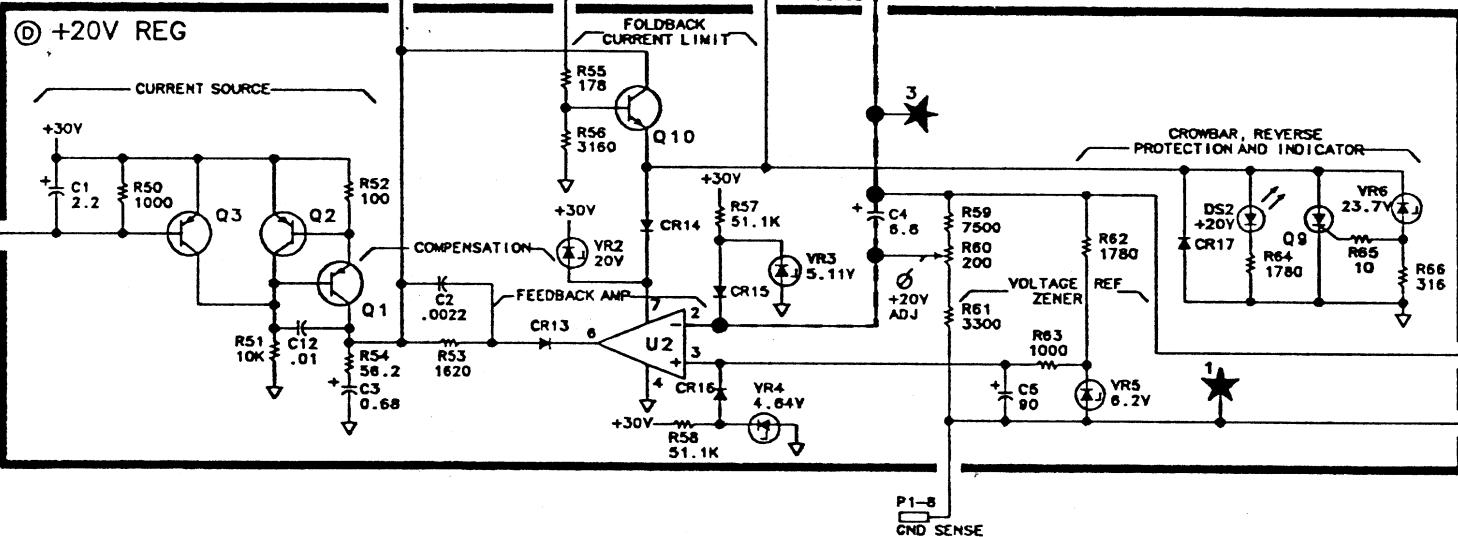

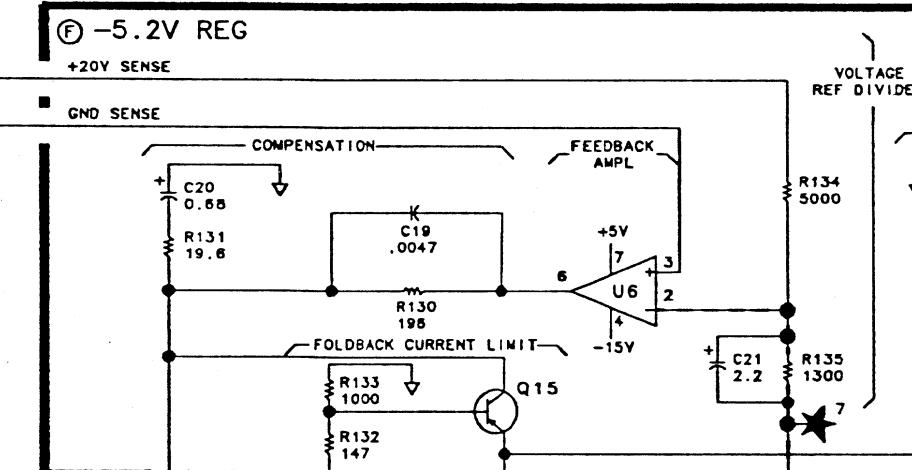

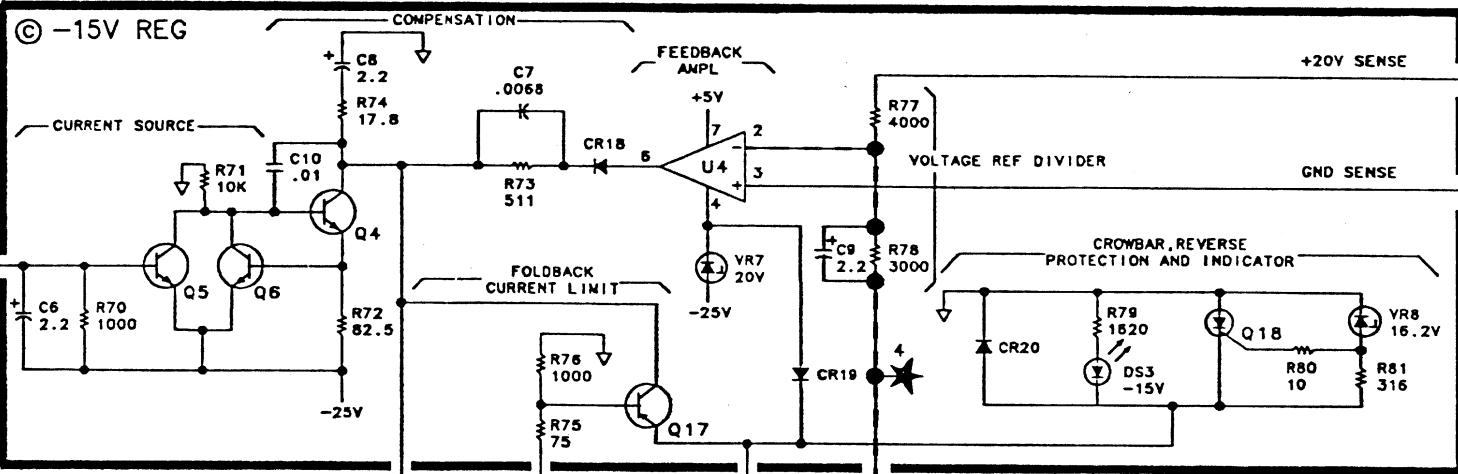

(D) +20V REG

(E) POWER UP

NOTES:

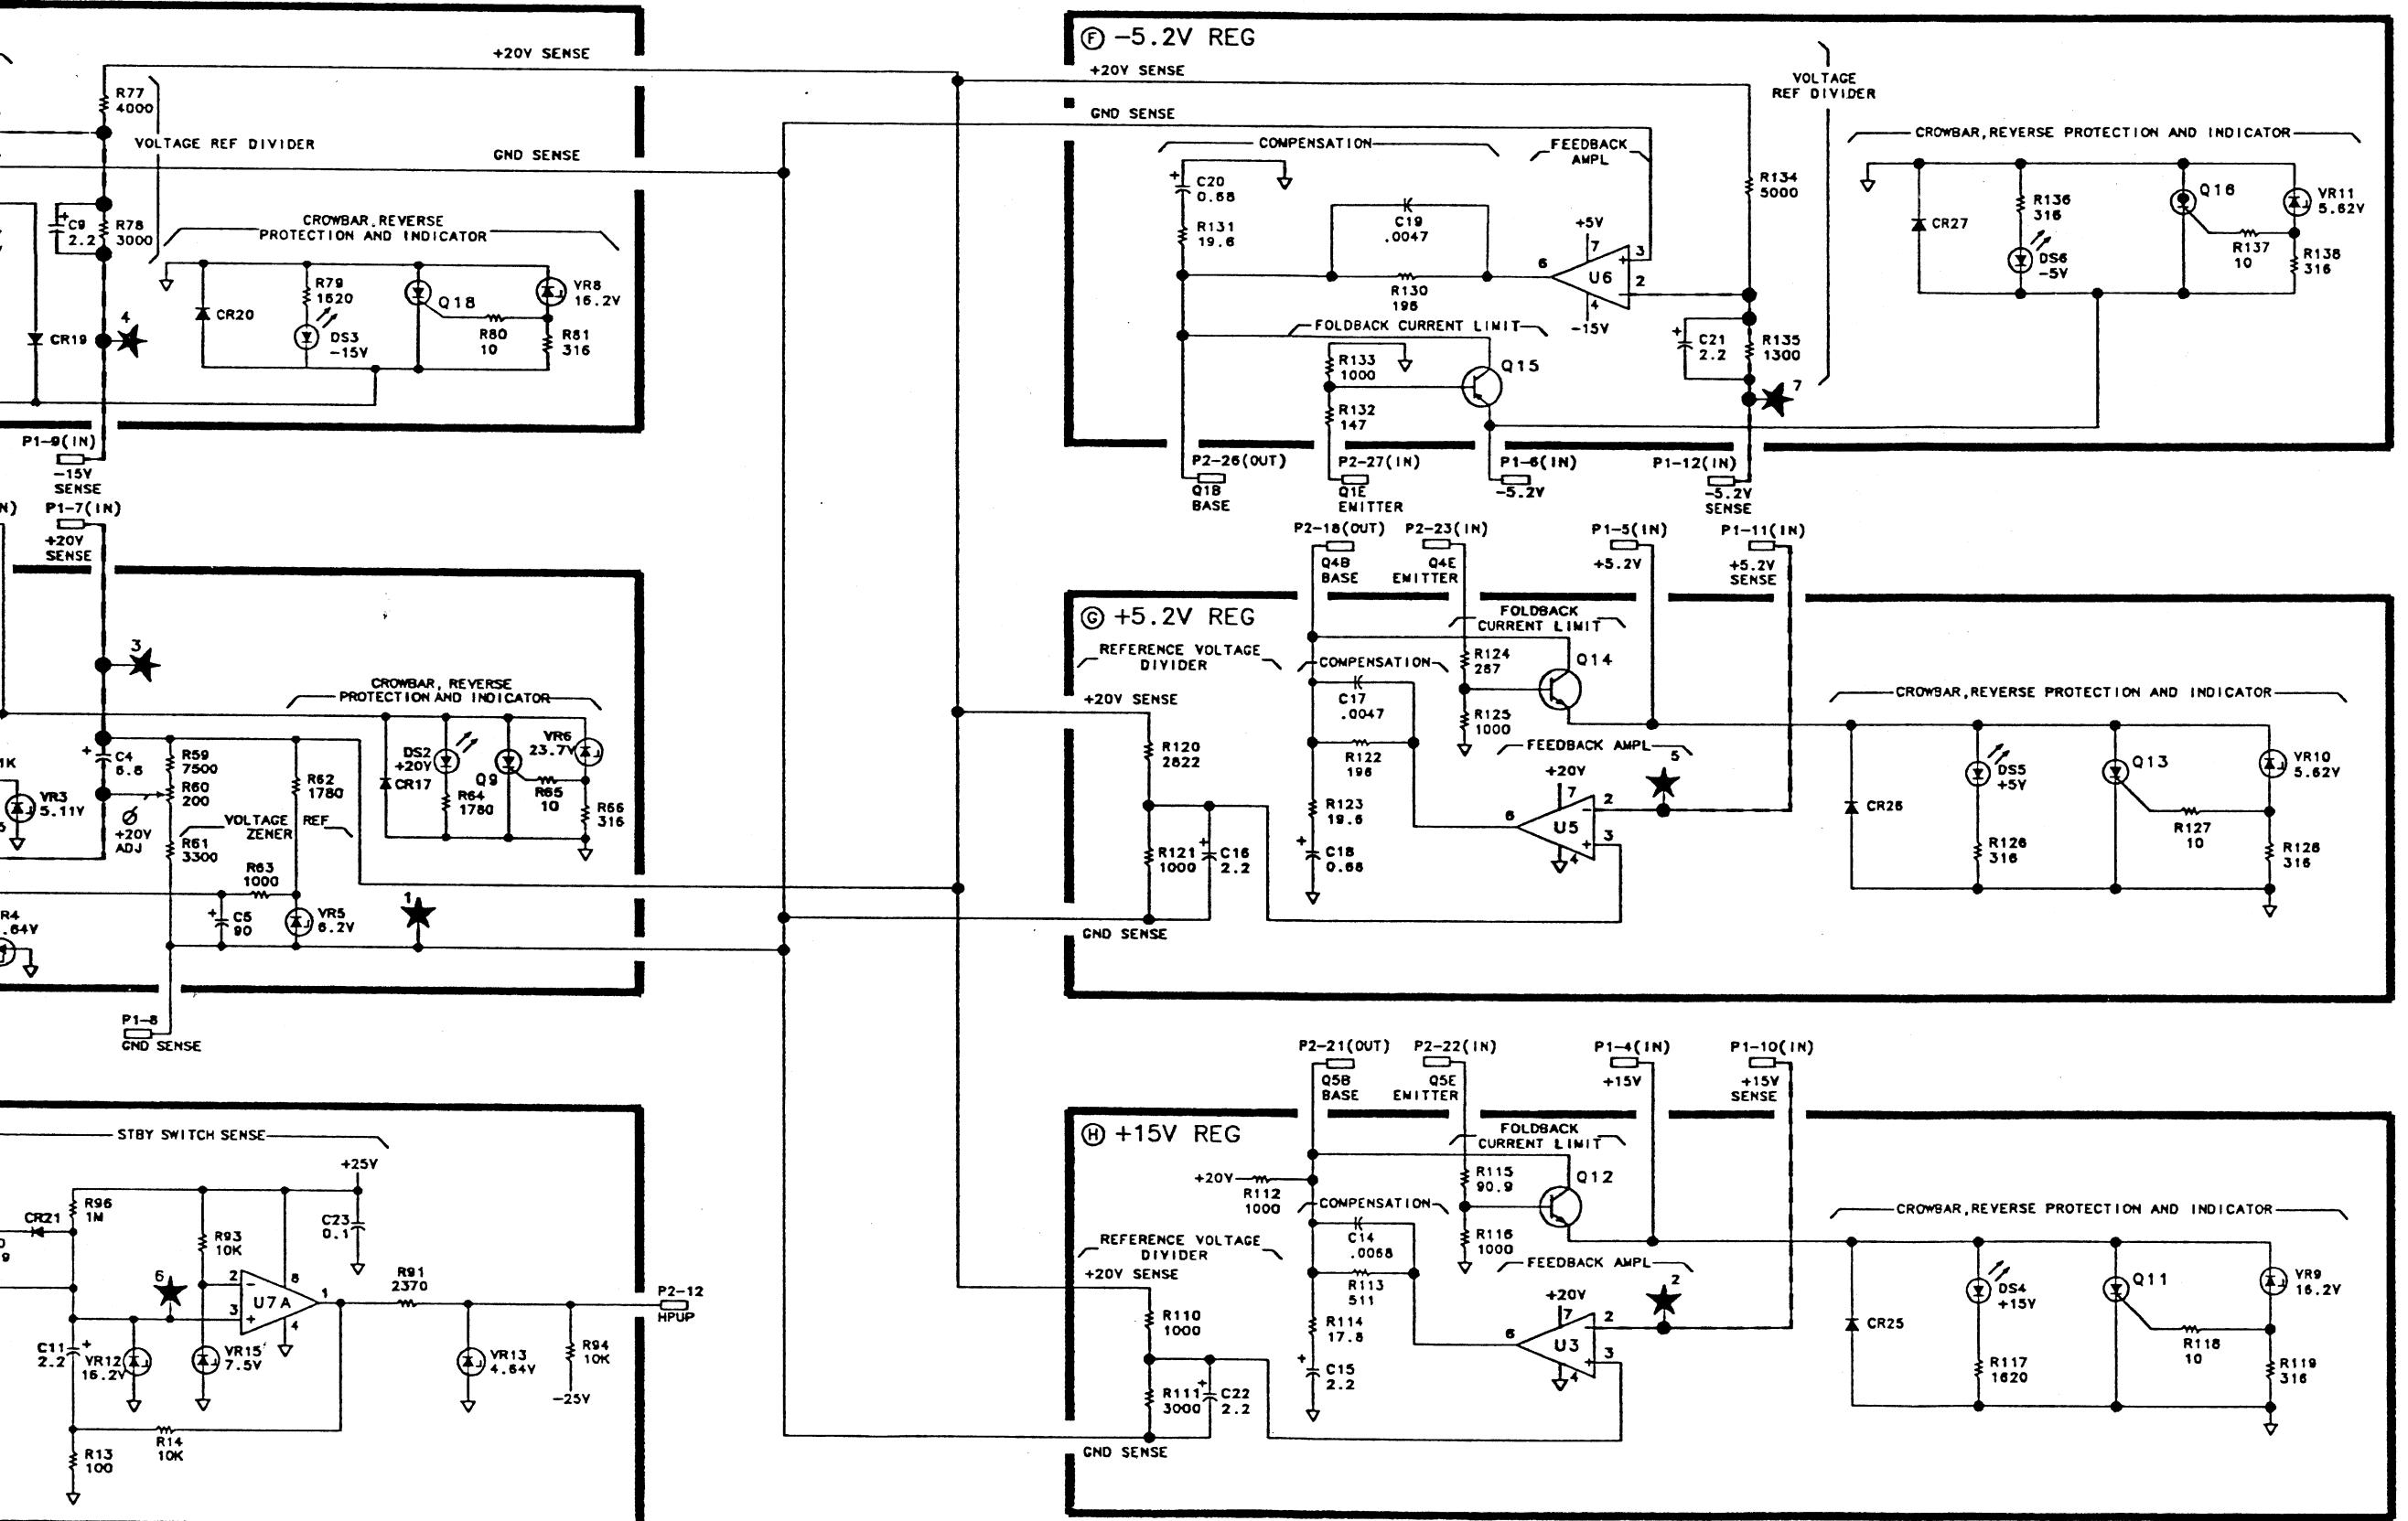

- REFERENCE DESIGNATORS WITHIN THIS ASSEMBLY ARE ABBREVIATED. FOR COMPLETE REFERENCE DESIGNATION, PREFIX ABBREVIATION WITH ASSEMBLY DESIGNATION.

- UNLESS OTHERWISE INDICATED: RESISTANCE IS IN OHMS (Ω) CAPACITANCE IS IN MICROFARADS (μF) INDUCTANCE IS IN MICROHENRIES (μH)

- UNLESS OTHERWISE INDICATED: SIGNALS ENTER AT LEFT SIDE AND EXIT AT RIGHT SIDE OF FUNCTION BLOCKS.

- MNEMONIC TABLE:

MNEMONIC	DESCRIPTION
HINT	EXT TIMEBASE 0V - EXT +5V - INT
HPUP	POWER UP +5V - POWER UP 0V - POWER DOWN
HOYC	OVEN COLD +5V - OVEN COLD 0V - OVEN ON
HTR PWR	HEATER POWER
OVN MNTR	OVEN MONITOR

A25 and A26

A25 Rectifier, Circuit Description

Power is supplied to the instrument through the Power Line Module and the Line Voltage Selector to the primary of transformer T1. Three center-tapped secondaries provide the rectified outputs.

Diodes CR1 through CR4 form a full-wave rectifier that provides an unregulated ± 10 V; CR5 through CR8, an unregulated ± 25 V; and CR9 and CR10, an unregulated +30 V. These are regulated by A24 Voltage Regulator to +5 V, -5.2 V, +15 V, -15 V, and +20 V. LED indicator DS1 indicates the presence of unregulated voltages.

CR1 and Q1 form a crowbar circuit for overvoltage protection. Fuses for the unregulated supplies are located on A26 Motherboard.

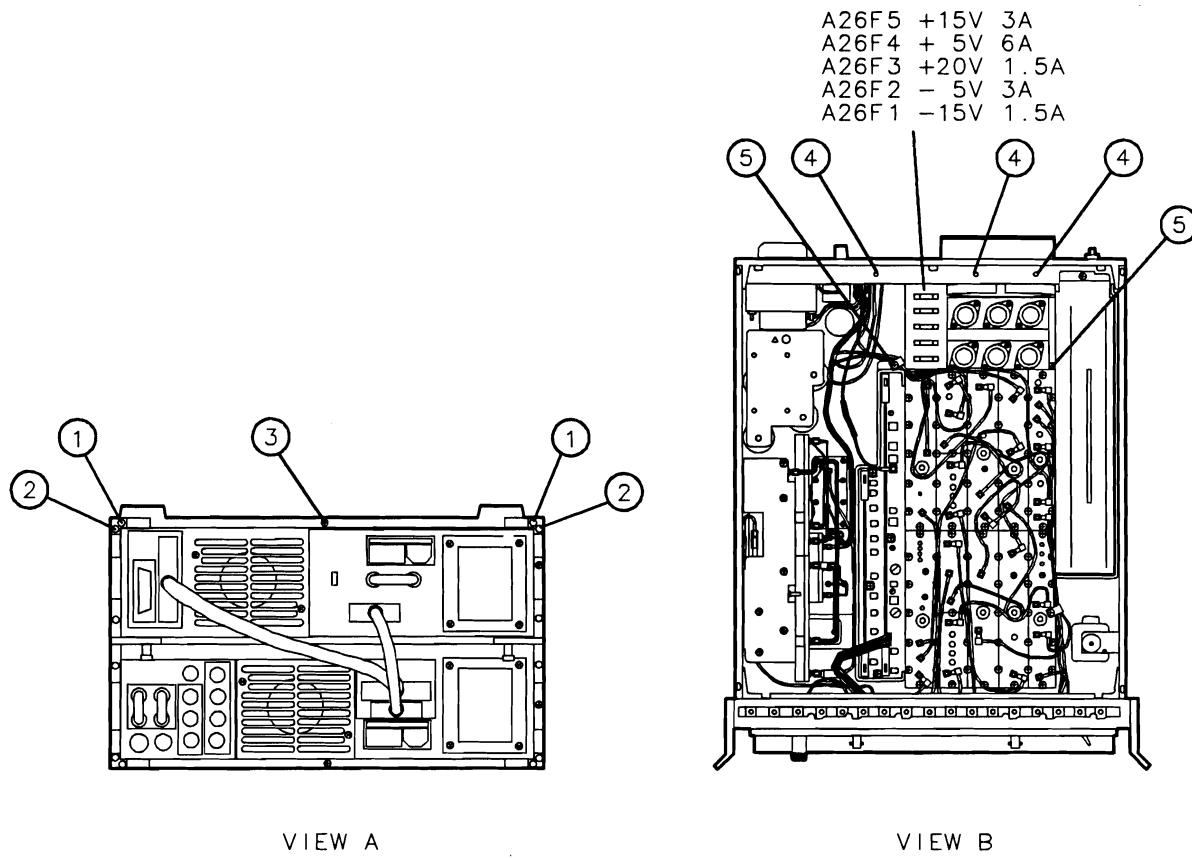

RF Section Internal Fuse Replacement

Warning

Remove ac line cords from both instruments before proceeding with this procedure.

1. Position instrument upside-down as show in View A of Figure 1.
2. Remove feet ① from rear of RF Section by removing screws ②.
3. Remove bottom cover from RF Section by loosening screw ③.
4. Remove shield from over fuses by removing rear screws ④ and front screws ⑤ shown in View B of Figure 1.
5. Location of fuses is shown in View B.

A27

A27 10 MHz Frequency Standard Circuit Description

The 10 MHz Frequency Standard provides a stable frequency reference signal for the A16 20 MHz Reference. The A16 20 MHz Reference in turn provides stable frequency reference signals of 10 MHz and 20 MHz to the rest of the instrument.

Alternately, the rear-panel FREQ REFERENCE jumper cable can be removed and an external 10 MHz reference signal can be connected to the EXTERNAL FREQUENCY REFERENCE INPUT on the rear panel of the instrument. The performance of the spectrum analyzer will be degraded unless the frequency reference phase noise and spurious signals are less than -140 dBc single sideband (1 Hz) referred to 10 MHz at a 100 Hz to 10 kHz offset.

The A27A1 Regulator Board assembly provides +12 V regulated voltage to the A27A2 Quartz Crystal Oscillator. Voltage Regulator IC, U1, provides +12 V regulation with C1 and C3 providing compensation and CR1 providing reverse-bias protection.

The A27A2 Quartz Crystal Oscillator is an extremely stable, compact, low-power source of 10 MHz. It has a very fast warm-up time, exhibits excellent temperature characteristics, and has low phase noise and power consumption.

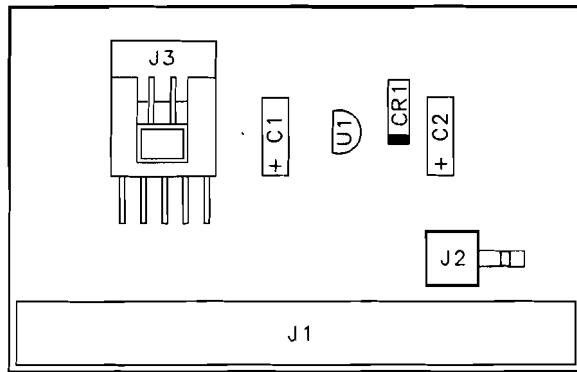

The A27A2 Quartz Crystal Oscillator has the ability to be adjusted over a range of 20 Hz (2×10^{-6}), yet the control is sensitive enough to allow adjustment to better than 0.1 Hz (1×10^{-8}).

A27

HP 85670A

HP 85670A RF Section

The HP 85670A is the RF Section of the HP 8567A Spectrum Analyzer. The HP 85670A is similar to the HP 85680B RF Section of the HP 8568B Spectrum Analyzer. The major assemblies that are different between the HP 85670A and the HP 85680B are listed below.

- A5 Front Panel Assembly
- A5A1 Keyboard
- A14 TCXO Buffer/A14Y1 TCXO of the HP 85670A replaces A27 10 MHz Frequency Reference of the HP 85680B
- A15 Controller
- A16 20 MHz Reference (HP 85670A Option 001 only)
- A26 Motherboard

These HP 85670A assemblies have part number changes from the standard HP 85680B assemblies. The assembly changes are documented either behind the tab for the assembly that changed or in this section of the manual. Parts lists for each of the HP 85670A assemblies are located in this section of the manual. Component locations, schematic diagrams, and other service sheets for the HP 85670A assemblies are incorporated onto the component location, schematic diagram, or appropriate service sheet of the standard HP 85680B version where possible. However, many instances require that an HP 85670A assembly have its own component location, schematic diagram, or service sheet. These versions are located in this section of the manual.

Table 1-1. HP 85670A Service Sheet Locations

A5 Front Panel, Circuit Description

A5 Front Panel includes the following subassemblies:

- A5A1 Keyboard
- A5A2 Rotary Pulse Generator
- A5A3 DC Input Connector

Also included is AT1 Step Attenuator (0 to 70 dB in 10-dB steps).

A5A1 Keyboard

A5A1 Keyboard includes all the front-panel pushbutton key-switches and indicator LEDs. (Refer to A12 RF Section Interface for a description of the key-switch circuitry.) The LEDs, which are driven by A12, indicate the status of pushbuttons, except for INSTR CHECK indicators I (DS2) and II (DS3).

The INSTR CHECK indicators are used with a self-test routine that is run whenever the LINE switch is placed ON or the **[INSTR PRESET]** key is pressed. The self-test routine checks the digital circuitry in the A15 Controller, portions of A12 RF Section Interface, and A3 Digital Storage in the IF-Display Section. Both LEDs are lit until the self-test routine is completed. If both LEDs remain on, the trouble is probably in A15, INSTR CHECK II indicates probable trouble in A12 or the Instrument Bus, and INSTR CHECK I indicates probable trouble in the A3 Digital Storage section of the IF-Display Section.

A5A2 Rotary Pulse Generator

A5A2 Rotary Pulse Generator (RPG) is operated by the DATA knob on the front panel. The rate and direction of rotation of the knob are transmitted to A12 RF Section Interface on the 01 and the 02 lines.

A5A3 DC Input Connector

A5A3 DC Input Connector is only used for signals which have no DC component.

ON/STANDBY Control

When the LINE switch is in STANDBY, a circuit is completed to A26 Motherboard to light STANDBY indicator LED DS1. The LED is lit when the instrument is in STANDBY or when regulated power to the instrument is removed during thermal shutdown.

Reference Level Amplitude Calibration

AMPTD CAL screwdriver adjustment R3 provides a REF LEVEL CAL voltage to A22 Frequency Control.

CAL OUTPUT

The CAL OUTPUT connector provides a 20 MHz, -10 dBm signal from A16 20 MHz Reference.

A14 TCXO Buffer Circuit Description

The TCXO Buffer Printed Circuit Board Assembly provides mounting for the Temperature Compensated Crystal Oscillator (TCXO), and contains a TCXO output buffer circuit, power switching, and filtering.

Q2 is a power switch to remove power from the TCXO and the Buffer when the Rear Panel External Input Switch is in 'External.' This prevents the TCXO output from interfering with the external reference signal. C5 to C8, and L2 filter the +12 V. C11 and C12 filter the OSC PWR switch control line. OSC PWR is approximately +20 V when HIGH and provides approximately 1 mA to the base of Q2, saturating it.

C1, C3, and C4 are dc blocking capacitors. C2 and L1 form a 10 MHz filter to attenuate harmonics of the reference oscillator. R1 and R2 set the bias for Q1 at 4.5 mA. R3 is the emitter load for Q1 emitter follower. This buffer amplifier isolates the TCXO's TTL output from the 50 ohm load on the A16 board.

LTCR	LOW-TRACKING GENERATOR REQUEST
LIDA	INTERNAL DATA AND ADDRESS BITS (LOW TRUE)
HWW	HIGH-WIDE LOOP SW

Options

List of Options

Option 001 - 75Ω Input

This option has a 75Ω BNC RF input instead of the standard 50Ω input.

Option 400 - 400 Hz Line Frequency

This option allows for operation using a 400 Hz line frequency. The rear panel fan is changed and a Printed Circuit board assembly with a start-up capacitor is added for this option.

Option 010 - Rack Mount Slide Kit

This option supplies the necessary hardware and installation instructions for mounting an instrument on slides into a rack of 482.6 mm (19 inch) spacing. The heavy-duty slides are designed specifically to support the weight of this spectrum analyzer. Option 010 is also available as a kit (HP Part Number 5062-6407).

Option 080 - Information Cards in Japanese

This option provides information cards for the tray beneath the RF Section in the Japanese language.

Option 081 - Information Cards in French

This option provides information cards for the tray beneath the RF Section in the French language.

Option 462 - Impulse Bandwidth

This option is the Impulse Bandwidth/6 dB Bandwidth option. Resolution bandwidths from 1 kHz through 3 MHz are impulse bandwidths. Resolution bandwidths from 10 Hz through 300 Hz are 6 db bandwidths. Not available on HP 8567A.

Option 908 - Rack Flange Kit (without handles)

This option supplies the necessary hardware and installation instructions for mounting an instrument, without handles, into a rack of 482.6 mm (19 inch) spacing. Option 908 is also available as a kit (HP Part Number 5062-3986).

Option 913 - Rack Flange Kit (with handles)

This option supplies the necessary hardware and installation instructions for mounting an instrument, with handles, into a rack of 482.2 mm (19 inch) spacing. Option 913 is also available as a kit (HP Part Number 5062-3986).

Option H44 and Option H96

HP 85680B Option H44 is the RF section used with HP 8568B Option E44. HP 85680B Option H96 is the RF section used with HP 8568B Option E96. The HP 85680B Options H44 and H96 major assemblies that are different than the standard HP 85680B are listed below.

- A5 Front Panel Assembly
- A5A1 Keyboard
- A14 TCXO Buffer/A14Y1 TCXO of the HP 85680B Option H44 and of Option H96 replace A27 10 MHz Frequency Reference of the standard HP 85680B
- A15 Controller
- A26 Motherboard

These HP 85680B Option H44 and Option H96 assemblies have part number changes from the standard HP 85680B assemblies. The assembly changes are documented in the section of the manual of the assembly that changed, in the HP 85670A section, or in this section of the manual. Parts lists, component locations, schematic diagrams, and other service sheets for the H44 and H96 option assemblies are incorporated onto the component location, schematic diagram, or appropriate service sheet of the standard HP 85680B version where possible. Some of these assemblies are common to the HP 85670A assemblies and wherever possible, the services sheets are located in the HP 85670A section of the manual. However, some instances require that an HP 85680B Option H44 or H96 assembly have its own component location, schematic diagram, or service sheet. These versions are located in this section of the manual.

A5 Front Panel, Circuit Description

A5 Front Panel includes the following subassemblies:

- A5A1 Keyboard
- A5A2 Rotary Pulse Generator
- A5A3 DC Input Connector

Also included is AT1 Step Attenuator (0 to 70 dB in 10-dB steps).

A5A1 Keyboard

A5A1 Keyboard includes all the front-panel pushbutton key-switches and indicator LEDs. (Refer to A12 RF Section Interface for a description of the key-switch circuitry.) The LEDs, which are driven by A12, indicate the status of pushbuttons, except for INSTR CHECK indicators I (DS2) and II (DS3).

The INSTR CHECK indicators are used with a self-test routine that is run whenever the LINE switch is placed ON or the **(INSTR PRESET)** key is pressed. The self-test routine checks the digital circuitry in the A15 Controller, portions of A12 RF Section Interface, and A3 Digital Storage in the IF-Display Section. Both LEDs are lit until the self-test routine is completed. If both LEDs remain on, the trouble is probably in A15, INSTR CHECK II indicates probable trouble in A12 or the Instrument Bus, and INSTR CHECK I indicates probable trouble in the A3 Digital Storage section of the IF-Display Section.

A5A2 Rotary Pulse Generator

A5A2 Rotary Pulse Generator (RPG) is operated by the DATA knob on the front panel. The rate and direction of rotation of the knob are transmitted to A12 RF Section Interface on the 01 and the 02 lines.

A5A3 DC Input Connector

A5A3 DC Input Connector is only used for signals which have no DC component.

ON/STANDBY Control

When the LINE switch is in STANDBY, a circuit is completed to A26 Motherboard to light STANDBY indicator LED DS1. The LED is lit when the instrument is in STANDBY or when regulated power to the instrument is removed during thermal shutdown.

Reference Level Amplitude Calibration

AMPTD CAL screwdriver adjustment R3 provides a REF LEVEL CAL voltage to A22 Frequency Control.

CAL OUTPUT

The CAL OUTPUT connector provides a 20 MHz, -10 dBm signal from A16 20 MHz Reference.

General Parts Listing

Introduction

This chapter contains information on ordering replacement parts and assemblies. The parts lists document all assembly versions up to the time that the manual is printed.

Table 1 lists reference designations, abbreviations, and value multipliers used in the parts lists.

Table 2 lists the names and addresses that correspond to the manufacturer code numbers in the parts lists.

Table 3 lists the various types of AC power cables that are available, their description, and part numbers.

Table 4 lists all major assemblies, part numbers, and descriptions of the assemblies.

Table 5 lists cables, part numbers, and descriptions of the cables .

Table 6 lists miscellaneous parts, part numbers, and descriptions of the parts.

Figures 1 through 7 illustrate the locations of instrument assemblies and hardware with the part numbers listed.

General Parts List Format

The following information is listed for each part:

1. The Hewlett-Packard part number.
2. The part number check digit (CD).
3. The total quantity (Qty) in the assembly. (This number is stated once and only at the first mention of the part.)
4. The description of the part.
5. A five-digit code indicating a typical manufacturer of the part.
6. The manufacturer part number.

Ordering Information

To order a part listed in the general parts table, quote the HP part number, include the check digit, and indicate the quantity required. Address and mail the order to the Hewlett-Packard Sales and Service Office nearest you. The check digit ensures accurate and timely processing of your order.

To order a part that is not listed in the general parts table, include the function and description of the part, and the number of parts required. Address and mail the order to the Hewlett-Packard Sales and Service Office nearest you.

Direct Mail-Order System

Within the USA, Hewlett-Packard can supply parts through a direct mail-order system. Advantages of using the system are as follows:

1. Direct ordering and shipment from the Hewlett-Packard Parts Center in Mountain View, California.
2. No maximum or minimum quantity requirement on any mail order. (There is a minimum-order quantity imposed on orders made through the Hewlett-Packard Sales and Service Offices when the orders require billing and invoicing.)
3. Prepaid transportation. (There is a handling charge added to each order.)
4. No invoices.

A check or money order must accompany direct-mail orders. Mail-order forms and specific ordering information are available from Hewlett-Packard Sales and Service Offices.

Direct Phone-Order System

A phone-order system is available within the USA for regular and hotline replacement parts service. Hewlett-Packard has provided a toll-free phone number, and accepts Mastercard or Visa for orders.

Regular Orders

The toll-free phone number is (800) 227-8164. It is available 6 am to 5 pm (Pacific time), Monday through Friday. Regular orders require a four-day delivery time.

Hotline Orders

The hotline service for ordering emergency parts is available 24 hours a day, 365 days a year. There is an additional charge on hotline orders to cover the cost of freight and special handling.

The toll-free hotline phone number is (800) 227-8164, available 6 am to 5 pm (Pacific time), Monday through Friday. The phone number for after-hours, weekends, and holidays is (415) 968-2347. Hotline orders are normally delivered the following business day.
