SECTION 1

SPECIFICATIONS

1.1 FREQUENCY RANGE

RCB-3	0.5 MHz to 1 GHz
RCB-3/75	0.5 MHz to 1 GHz
RCB-4	0.5 MHz to 2.5 GHz

1.2 IMPEDANCE

RCB-3	50 ohm
RCB-3/75	75 ohm
RCB-4	50 ohm

NOTE: The specified bridge impendances are correct only when the signal is leveled at the bridge input (Figure 1). Without such external leveling the 50-ohm bridges appear as 83.3 ohms, and the 75-ohm bridge appears as 125 ohms.

1.3 RETURN LOSS (UNBALANCE)

RCB-3	40 dB
RCB-3/75	40 dB
RCB-4	40 dB @ 1 GHz, 25 dB @ 2.5 GHz

1.4 OUTPUT POLARITY

Negative (all models)

1.5 ALC DETECTOR POLARITY

Negative (all models).

1.6 OUTPUT TIME CONSTANT

10 usec (all models).

1.7 STANDARD CONNECTORS

RCB-3 & RCB-4

RF Input	Type N Female
Z1 Test Port	Type N Female
Z2 Test Port	Type N Female
DC Output	BNC Female
ALC Output	BNC Female

RCB-3/75

RF Input	70 ohm Type N Female
Z1 Test Port	70 ohm Type N Female
Z2 Test Port	70 ohm Type N Female
DC Output	BNC Female
ALC Output	BNC Female

1.8 SENSITIVITY (Typical output with o.5V rms input @ 1 GHz)

1.1:1 VSWR	2mV
1.2:1 VSWR	8mV
1.5:1 VSWR	30mV
2.0:1 VSWR	65mV

1.9 WEIGHT

RCB-3 & RCB-4	6 oz.
RCB-3/75	8 oz.

1.10 REFLECTION COEFFICIENT KITS

Texscan Reflection Coefficient Bridges are available with mismatches.

QUANTITY	KRCB-3	KRCB-4	KRCB-3/75
1	RCB-3	RCB-4	RCB-3/75
2	MF-50 1.0:1	MF-50 1.0:1	MF-75 1.0:1
1	MF-50 1.2:1	MF-50 1.2:1	MF-75 1.2:1
1	MF-50 1.5:1	MF-50 1.5:1	MF-75 1.5:1
1	MF-50 2.0:1	MF-50 2.0:1	MF-75 2.0:1

SECTION 2

GENERAL DESCRIPTION

2.1 GENERAL DESCRIPTION :

The reflection coefficient bridges are broad band RF comparators. These devices develop a DC potential with respect to ground which is proportional to the degree of unbalance in the arms of the bridge circuit. The bridges provide DC isolation to prevent undesired loading of the circuitry by associated test equipment.

2.2 THEORY OF OPERATION (ALL MODELS)

The bridge circuit is comprised of R3, R4, the external reference and the unknown impedance. C2 and C3 isolate the bridge arms for DC. A voltage is generated across CR1 which is proportional to the degree of mismatch between the reference termination and the unknown termination. R2 provides a high impedance ground return which minimizes bridge loading. R1 isolates the oscilloscope loading affects. CR2 and C4 form a peak detector which provides an external leveling voltage for the sweep generator input. C1 bypasses any RF components before coupling to the oscilloscope.

SECTION 3

INITIAL SETUP AND CALIBRATION

3.1 PRELIMINARY SETUP - SEE FIGURE 1

3.1.1	Connect RCB	To:
	RF IN	Sweep generator RF output
	DC OUT	Sweep generator VIDEO IN
	MONITOR OUT	Sweep Generator EXT MONITOR
	Z1	50 or 75 ohm reference termination
	Z2	1.0:1 VSWR mismatch
3.1.2	Connect Sweep Generator	To:
	Scope VERT	Oscilloscope vertical INPUT
	Scope HORIZ	Oscilloscope Horizontal INPUT
3.1.3	Set Sweep Generator	To:
	Center Freq.	Range desired
	Sweep width	As desired
	MONITOR	EXTERNAL
	MARKERS	ON (as desired)
	Attenuators	As required
3.1.4	Oscilloscope	To:
	Vertical coupling	DC coupling
	Vertical range	As necessary to display trace
	Horizontal gain	As required

3.2 Calibrate the oscilloscope graticule in VSWR as follows:

3.2.1 Connect a 50 ohm termination to Z2 (1.0:1 VSWR)

3.2.2 Adjust the oscilloscope for a base line trace at the top of the screen.

3.2.3 Connect a 1.05:1 VSWR calibrated mismatch to Z2.

3.2.4 Note the position of the trace on the graticule and mark the position with grease pencil or other suitable marking device.

3.2.5 Repeat 3 and 4 with as many calibrated mismatches as required to cover the VSWR range needed.

SECTION 4

APPLICATIONS

4.1 It is possible to determine several important parameters of four terminal devices such as filters, transmission lines and amplifiers using a reflection coefficient bridge and associated equipment. The following parameters may be determined.

1. VSWR
2. Structural return loss.
3. Insertion loss.
4. Load VSWR for measured generator VSWR.

The application of these parameters may be applied to many facets of electronic testing, for example:

Antenna measurements

Antenna matching

Return loss for CATV

Insertion loss of devices

Cable testing

Determination of amplitude and phase difference between a known and unknown device.

4.2 EQUIPMENT REQUIRED:

Sweep Generator w/markers	Texscan VS-90 or equivalent
Oscilloscope	Texscan DU-88 or equivalent
Calibrated attenuators	Texscan KFP series or LA series or equivalent
Calibrated mismatches	Texscan MF series or equivalent
Calibrated RF Source	
Electronic Switch	Jerrold/Texscan TC-2 or equivalent
Calibrated phase shifter	(Special)

4.3 ANTENNA MEASUREMENTS

4.3.1 Perform the preliminary setup and calibration. See Figure 1.

4.3.2 Connect the antenna to be tested to Z2.

4.3.3 Read the VSWR from the oscilloscope.

4.3.4 Insert markers to determine the frequency vs VSWR characteristics of the antenna under test.

4.3.5 If the length of cable between the antenna and the RCB is great, the apparent VSWR at the bridge is not true antenna VSWR. Refer to Figure 3 for VSWR reduction vs cable attenuation. A method of determining cable attenuation is provided in a following section. Manufacturer's data may also be consulted for attenuation characteristics of a particular cable. Consult Figure 4 for correlation of power loss due to VSWR.

4.4 STRUCTIONAL RETURN LOSS OF CABLE

Structional return loss (SRL) is caused by imperfections in cable construction. Reflections occur from variations in cable diameter, dielectric imperfections, sharp bends, conduction misplacement, etc. These reflections prevent a certain portion of the incident power from reaching the load. Structural return loss is a measure of the quality of a cable.

NOTE: Structural return loss is one component of return loss. Load and generator mismatch contribute to the total return loss unless they are made equal to the characteristic impedance of the cable being measured.

4.4.1 Perform the initial setup and calibration. See Figure 1.

4.4.2 Terminate the cable in its characteristic impedance.

4.4.3 Connect the cable to Z2.

4.4.4 Measure the VSWR at the frequencies desired.

4.4.5 Refer to Figure 2 and read SRL in terms of observed VSWR.

4.5 INSERTION LOSS

In cables, insertion loss is comprised of resistive losses (skin effect) and dielectric losses. Each of these parameters increases with frequency. In filters the lumped constants have similar losses. The insertion loss may be determined by observing the reflections from an open or short circuited output. The initial assumption is that the cable or device is matched to the generator.

4.5.1 Perform the initial setup and calibration.

4.5.2 Open Circuit (or short circuit) one end of the device.

4.5.3 Connect the device to Z2.

4.5.4 Read the VSWR at the desired frequency.

4.5.5 Refer to a table for correlation of VSWR to insertion loss. See Figure 5.

4.6 DETERMINATION OF AMPLITUDE AND PHASE MEASUREMENT

4.6.1 Set up the equipment as shown in Figure 6.

NOTE: A dual trace oscilloscope may be used instead of an electronic switch; however, only one channel will have marker capability. This provides simultaneous monitoring of input and output characteristics for matching purposes.

4.6.2 Remove both the known and unknown devices, connecting the attenuators directly to the RCB.

4.6.3 Adjust the variable attenuator and variable phase shifter to obtain a null in output from RCB-2.

4.6.4 Insert the known and unknown devices per Figure 6.

4.6.5 Adjust the device under test (unknown) until a null is observed at the frequency of interest. The unknown device will not match the known device in attenuation and phase angle.

4.6.5a. Adjust the variable attenuator and variable phase shifter to obtain a null from RCB-2. The difference in attenuation between the fixed attenuator and the variable attenuator indicate attenuation or gain of the device under test. The difference in attenuation between the fixed phase shifter and the variable phase shifter is the phase shift induced by the device under test.

NOTE: Possible applications: Alignment of 0 phase shift filters. Comparison of filter attenuation and phase to a Quality Assurance standard or other specification. Adjustment of amplifier for gain and phase shift.

SECTION 5

ALIGNMENT

5.1 Perform the initial setup and calibration procedure.

5.2 Connect a 1.0:1 VSWR termination to Z1 and Z2.

5.3 Remove the cover of the RCB.

5.4 In the RCB-3 or RCB-4 the tuning line tabs may be adjusted to balance the bridge. Adjust the tuning line tabs and component lead dress for minimum output across the frequency range desired. The tuning line tabs are indicated as a ghost capacitor on Figure 7. The output at the DC out port should be at least 40 dB below the reference output. Reference output voltage may be measured by placing a CD-51 detector at Z2.

5.5 The RCB-3/75 has no tuning lines. Component lead dress only should be adjusted to align the RCB-3/75. The Z2 to DC out isolation should be at least 40 dB. See Figure 8.

NOTE: Since the RCB cover plate also provides some distributed capacity, the cover should be replaced after each adjustment and all isolation measurements made with the cover in place.

This completes the alignment procedures.

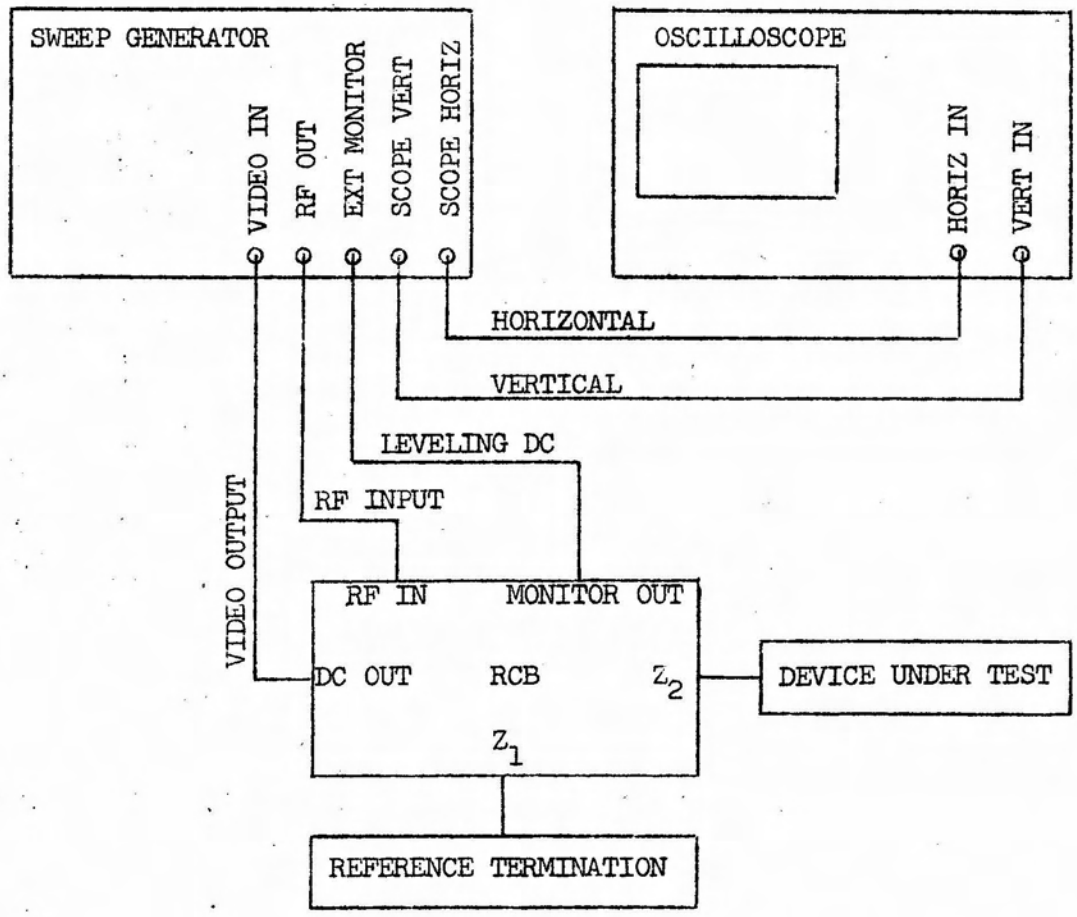

FIGURE 1: INITIAL SETUP FOR CALIBRATION

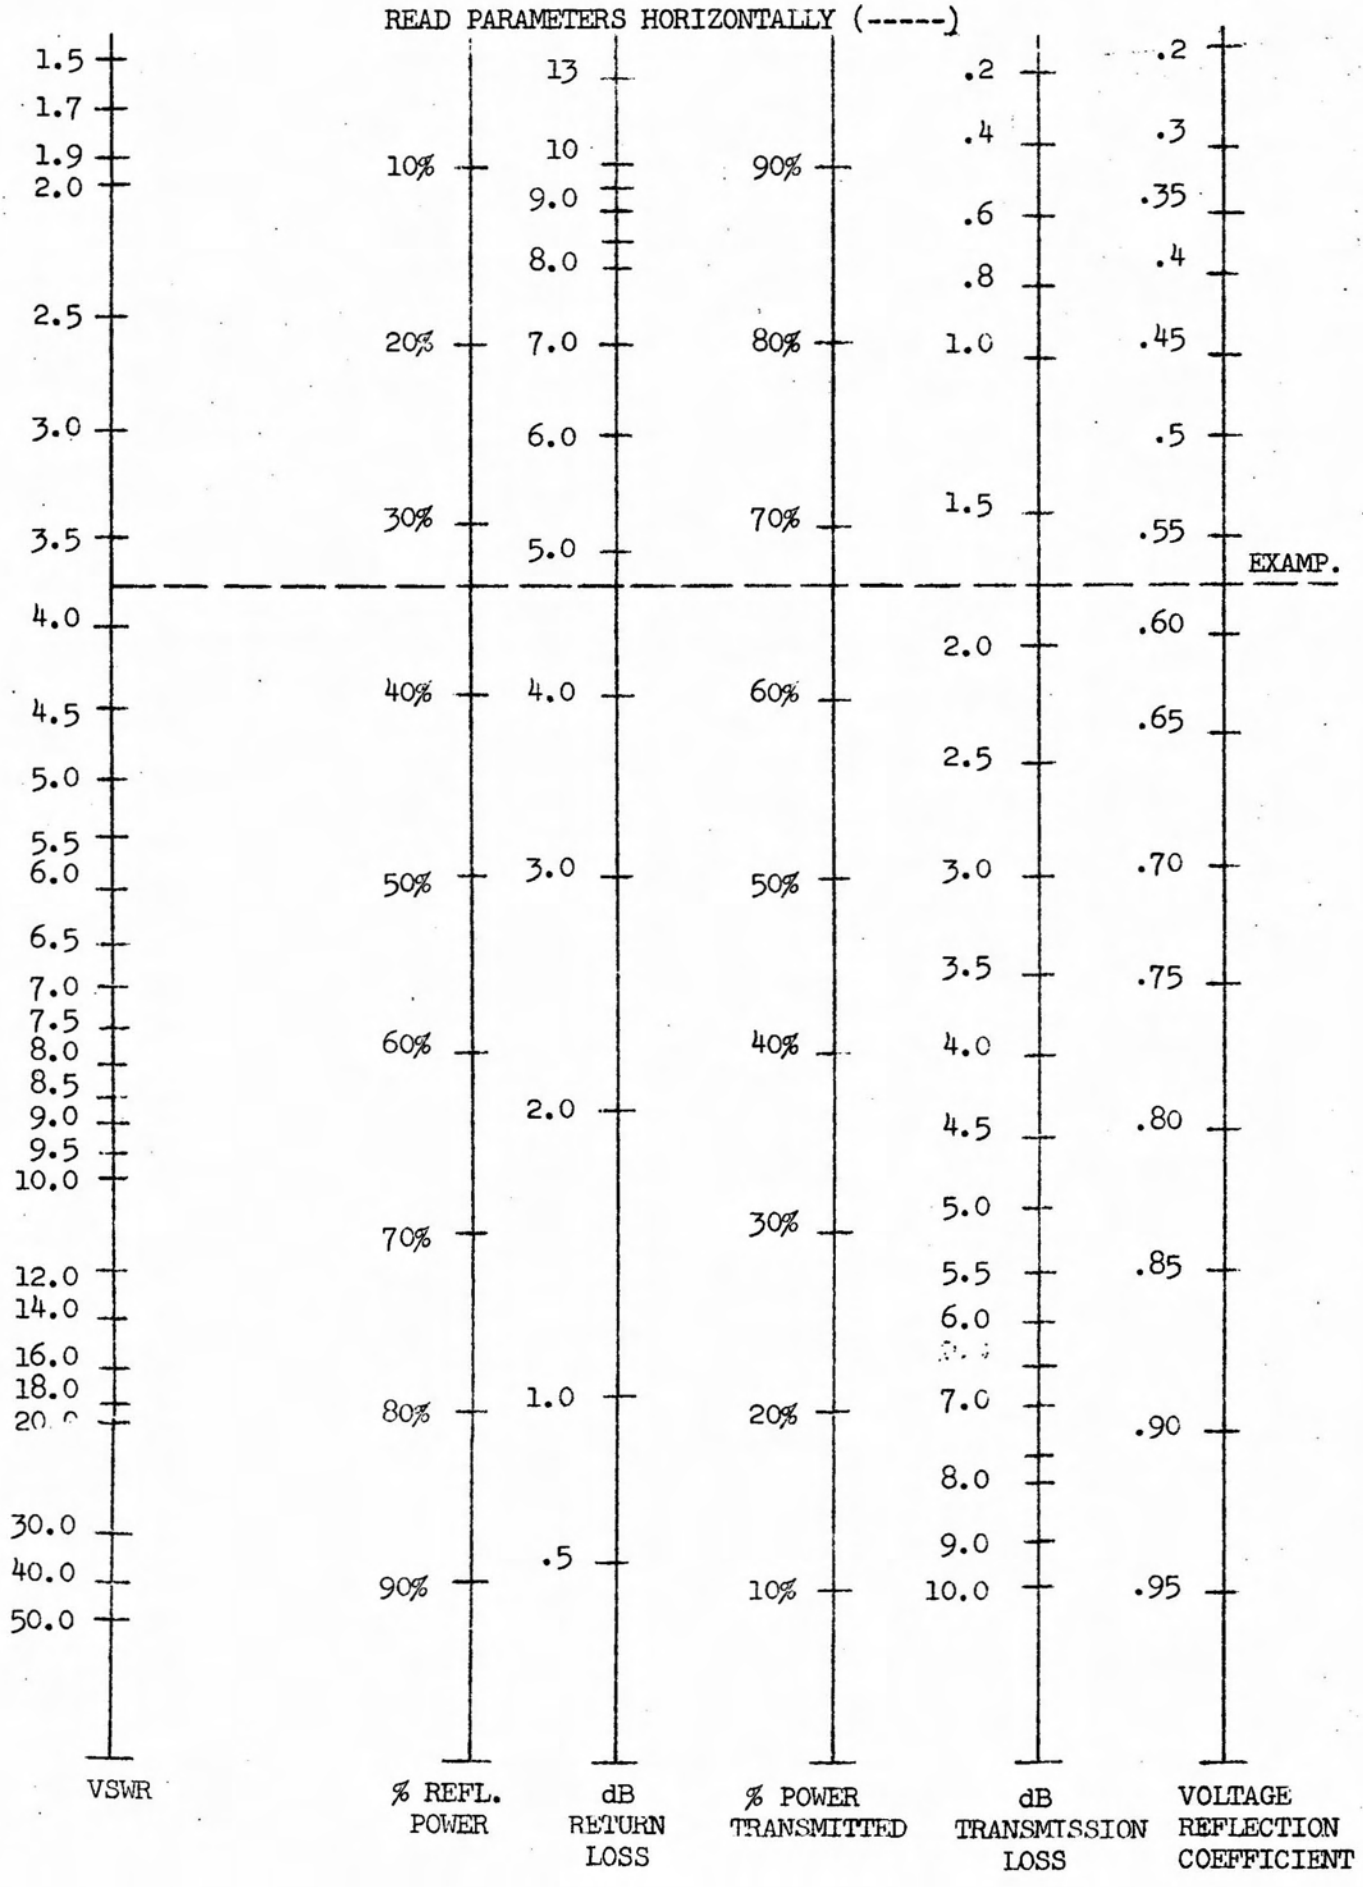

FIGURE 2: PARAMETERS RELATED TO VSWR

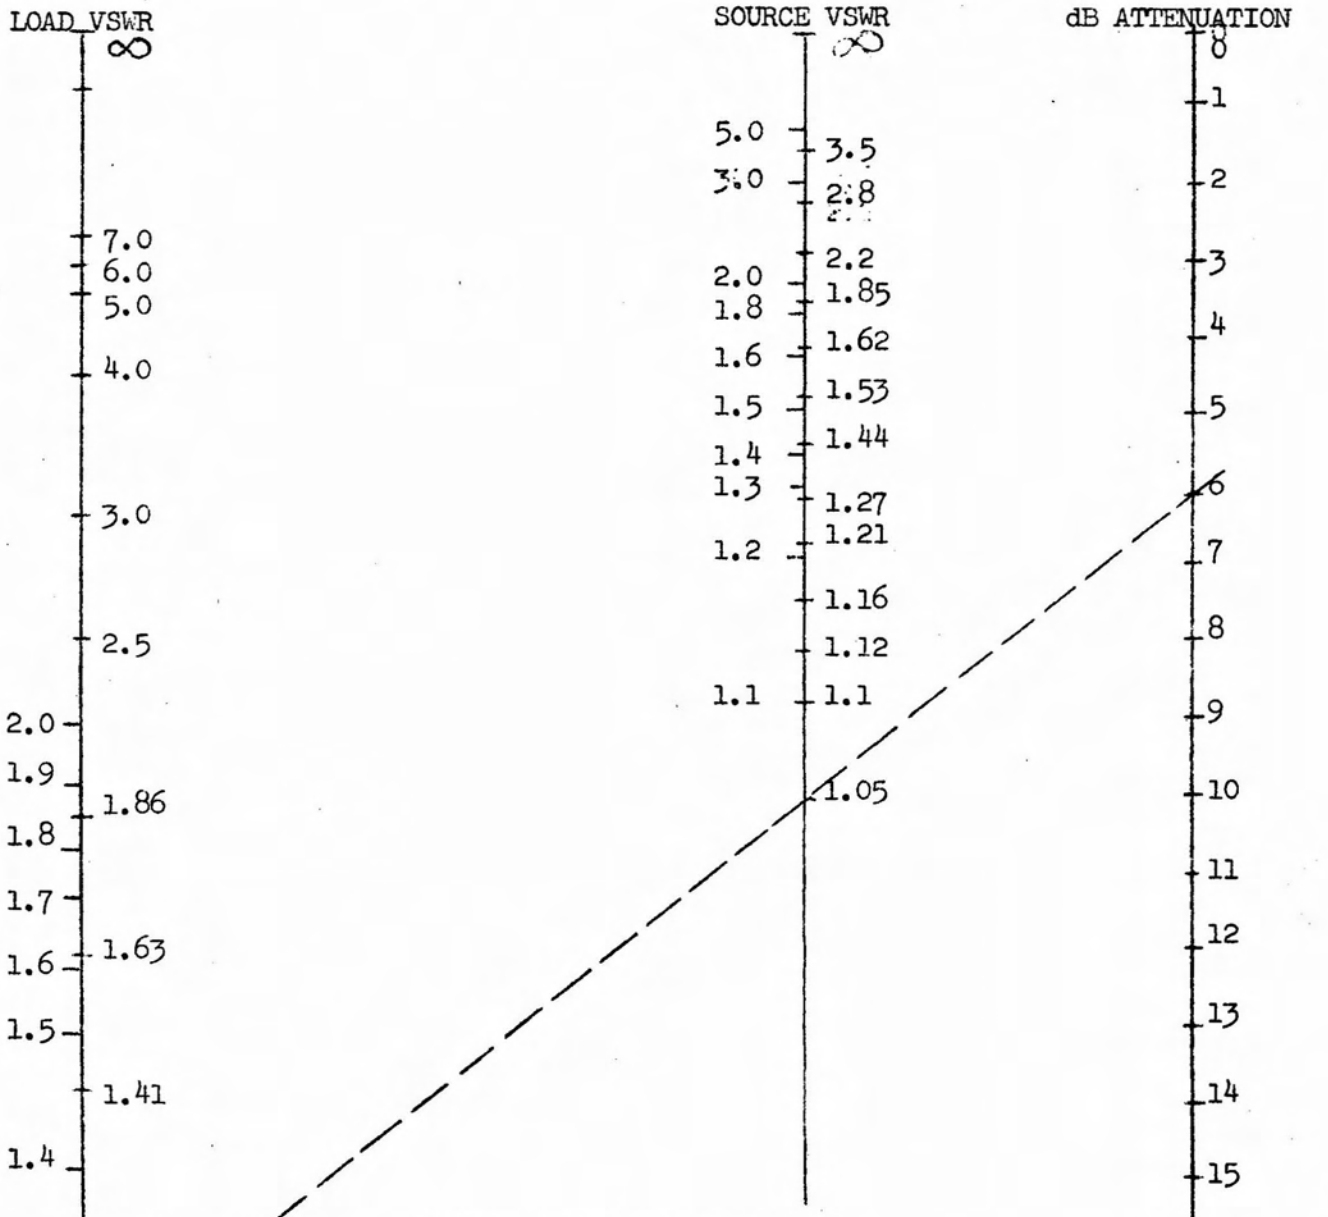
RCB



NOMOGRAPH OF VSWR REDUCTION
FOR GIVEN ATTENUATION

$$\text{Coth}^{-1} S_1 = \text{Coth}^{-1} S_2 + \frac{\alpha}{8.686}$$

When S_1 = VSWR AT THE SOURCE

S_2 = VSWR AT THE LOAD

α = ATTENUATION IN dB

BASIC EQUATION:

$$-10 \log_{10} \left(\frac{S_1 + 1}{S_1 - 1}\right) = -10 \log_{10} \left(\frac{S_2 + 1}{S_2 - 1}\right) - \alpha$$

CONDICTIONS OF SALE

Determination of prices, terms, conditions of sale, and final acceptance of orders are made only at our plant in Indianapolis, Indiana.

All prices are F.O.B. Indianapolis, Indiana, USA.

Terms in the United States and Canada are Net 30 days if credit has been arranged.

Terms throughout the rest of the free world are arranged with Texscan's area representative.

SERVICE AND PARTS

Repair service is available at our plant in Indianapolis, Indiana. Before returning an instrument for repair, please write to us, requesting a Returned Material Authorization. On receipt of shipping authorization, forward the instrument prepaid. Care should be taken in packing the instrument to insure protection in transit. Also, state the type and serial number of the instrument, date of purchase, and details concerning the difficulty.

Repair parts may be ordered from our home plant or through our sales representatives. When ordering repair parts, please specify the part number and description of the item, and the type and serial number of the instrument in which it is used.

TEXSCAN RECOMMENDS FACTORY REPAIR OF RF CIRCUITS

If failure occurs in an RF section of any TEXSCAN test instrument, TEXSCAN recommends that the complete instrument be returned to the factory for repair and calibration. Replacement of an RF assembly or component may result in failure of the instrument to meet its published specifications and failure to perform within its design capabilities. TEXSCAN Customer Service personnel are experienced in the repair and calibration of the complete line of TEXSCAN test instruments. When practical, updated improvements can be included in the reapired instrument.

SPECIFICATION CHANGES

The right is reserved to change the published specifications of equipment at any time, and to furnish merchandise in accordance with current specifications without incurring any liability to modify equipment previously sold.

WARRANTY

Products manufactured by Texscan Corporation are warranted against defective materials and workmanship for one year from date of shipment. Any instrument or component which has been found to be defective during this one-year period will be repaired or replaced without charge except for vacuum tubes or batteries which have given normal service. No other warranty is expressed or implied.

ORDERING INFORMATION

In the United States and Canada, please order through your local representative or directly with the factory. Your factory trained representative can supply technical data and latest price and delivery quotations.

The factory address is:

TEXSCAN CORPORATION
2446 North Shadeland Avenue
Indianapolis, Indiana 46219
Phone: 317-357-8781
TWX: 810-341-3184
Cable Address: TEXSCAN

In Western Europe, please order through your local representative, who can supply technical assistance and up-to-date price and delivery information.

Complete addresses and telephone numbers of Texscan's sales representatives are listed on the outside back cover of the catalogue.

SHIPPING INSTRUCTIONS

Unless specific instructions accompany the order, we shall use our own judgment as to the best method of shipment. Unless otherwise specified, normal shipments will be by air freight or air express. Small items are sent via parcel post. The listed price for our products include the packing, but does not include the cost of shipping.
