

01-9

The holder of a General Amateur Operator Certificate of Competency may:

- a retransmit public broadcasts
- b transmit in bands allocated to the Amateur Service
- c repair radio equipment for profit
- d transmit on public service frequencies

02-0

As the holder of a New Zealand General Amateur Operator Certificate of Competency, you may operate:

- a within your local Postal District
- b anywhere in the world
- c only at your home address
- d anywhere in New Zealand and in any other country that recognises the Certificate

03-4

A logbook for recording information about stations worked:

- a is compulsory for every amateur radio operator
- b must list all messages sent
- c is recommended for all amateur radio operators
- d must record time in UTC

04-4

Your amateur station is identified by transmitting your:

- a full name and address
- b "handle"
- c first name and location
- d callsign

05-6

A General Amateur Operator Certificate of Competency is usually issued for:

- a two years
- b five years
- c ten years
- d life

06-4

The following messages from an amateur station are expressly forbidden:

- a International No.2 code
- b Baudot code
- c ASCII
- d secret cipher

07-3

A station using the callsign "VK3XYZ stroke ZL" is heard on your local VHF repeater. This is:

- a the station of an overseas visitor
- b a confused person, probably with a stolen transceiver
- c an unauthorised callsign
- d an illegal operator

08-5

In New Zealand, the "15 metre band" frequency limits are:

- a 21.00 to 21.45 MHz
- b 21.00 to 21.40 MHz
- c 21.00 to 21.35 MHz
- d 21.00 to 21.30 MHz

09-7

The following band is an exclusive primary allocation for New Zealand amateur radio operators:

- a 21 to 21.45 MHz
- b 10.1 to 10.15 MHz
- c 146 to 148 MHz
- d 3.5 to 3.9 MHz

10-5

These magnetic poles will repel:

- a like
- b unlike
- c positive
- d negative

11-3

As the temperature increases, the resistance of a conductor:

- a increases
- b decreases
- c remains constant
- d becomes negative

12-4

The watt is the unit of:

- a magnetic flux
- b electromagnetic field strength
- c breakdown voltage
- d power

13-3

$I = E/R$ is a mathematical equation describing:

- a Ohm's Law
- b Thevenin's Theorem
- c Kirchoff's First Law
- d Kirchoff's Second Law

14-1

A circuit has a total resistance of 100 ohm and 50 volt is applied across it. The current flow will be:

- a 500 mA
- b 50 mA
- c 2 ampere
- d 20 ampere

15-5

Six identical 2-volt bulbs are connected in series. The supply voltage to cause the bulbs to light normally is:

- a 1.2 V
- b 12 V
- c 6 V
- d 2 V

16-8

Resistors of 68 ohm, 47 kilohm, 560 ohm and 10 ohm are connected in parallel. The total resistance is:

- a between 68 and 560 ohm
- b between 560 and 47 kilohm
- c greater than 47 kilohm
- d less than 10 ohm

17-8

A simple transmitter requires a 50 ohm dummy load. You can fabricate this from:

- a four 300 ohm resistors in parallel
- b five 300 ohm resistors in parallel
- c six 300 ohm resistors in parallel
- d seven 300 ohm resistors in parallel

18-4

The current in a 100 kilohm resistor is 10 mA. The power dissipated is:

- a 1 watt
- b 100 watt
- c 10,000 watt
- d 10 watt

19-4

Each of 9 resistors in a circuit is dissipating 4 watt. If the circuit operates from a 12 volt supply, the total current flowing in the circuit is:

- a 48 ampere
- b 36 ampere
- c 3 ampere
- d 9 ampere

20-5

The correct name for the equivalent of "one cycle per second" is one:

- a henry
- b volt
- c hertz
- d coulomb

21-7

The reactance of a capacitor increases as the:

- a applied voltage increases
- b frequency increases
- c frequency decreases
- d applied voltage decreases

22-3

A toroidal inductor is one in which the:

- a windings are air-spaced
- b windings are wound on a ferrite rod
- c inductor is enclosed in a magnetic shield
- d windings are wound on a closed ring of magnetic material

23-1

For your safety, before checking a fault in a mains operated power supply unit, first:

- a short the leads of the filter capacitor
- b check the action of the capacitor bleeder resistance
- c remove and check the fuse in the power supply
- d turn off the power and remove the power plug

24-3

A bipolar transistor has three terminals named:

- a base, emitter and drain
- b collector, base and source
- c drain, source and gate
- d emitter, base and collector

25-7

To bias a transistor to cut-off, the base must be:

- a at the collector potential
- b mid-way between collector and emitter potentials
- c at the emitter potential
- d mid-way between the collector and the supply potentials

26-9

A triode valve has this many grids:

- a one
- b two
- c three
- d three plus a filament

27-7

A good ammeter should have:

- a a very high internal resistance
- b a resistance equal to that of all other components in the circuit
- c an infinite resistance
- d a very low internal resistance

28-0

Assuming the same impedances, the input to an amplifier is 1 volt rms and the output 10 volt rms. This is an increase of:

- a 3 dB
- b 20 dB
- c 6 dB
- d 10 dB

29-4

In an HF station, the "linear amplifier" is:

- a an amplifier to remove distortion in signals from the transceiver
- b an amplifier with all components arranged in-line
- c a push-pull amplifier to cancel second harmonic distortion
- d an optional amplifier to be switched in when higher power is required

30-8

In a frequency modulation receiver, this is located between the frequency discriminator and the speaker and/or headphones:

- a limiter
- b intermediate frequency amplifier
- c audio frequency amplifier
- d radio frequency amplifier

31-1

In a single sideband and CW receiver, the output of this is connected to the mixer:

- a the radio frequency amplifier
- b the intermediate frequency amplifier
- c the audio frequency amplifier
- d a filter

32-7

The BFO in a superhet receiver operates on a frequency nearest to that of its:

- a IF amplifier
- b RF amplifier
- c audio amplifier
- d local oscillator

33-8

The abbreviation AGC means:

- a attenuating gain capacitor
- b anode-grid capacitor
- c amplified grid conductance
- d automatic gain control

34-4

A superhet receiver, with a 500 kHz IF, is receiving a signal at 21.0 MHz. A strong unwanted signal at 22 MHz is interfering. The cause is:

- a insufficient IF selectivity
- b the 22 MHz signal is out-of-band
- c 22 MHz is the image frequency
- d insufficient RF gain

35-3

A single conversion receiver with a 9 MHz IF has a local oscillator operating at 16 MHz. The frequency it is tuned to is:

- a 16 MHz
- b 7 MHz
- c 21 MHz
- d 9 MHz

36-2

The primary source of noise that can be heard in a UHF band receiver with its antenna connected is:

- a detector noise
- b atmospheric noise
- c man-made noise
- d receiver front-end noise

37-3

In an elementary frequency modulation transmitter, this is located between the modulator and the frequency multiplier:

- a speech amplifier
- b oscillator
- c power amplifier
- d microphone

38-8

In a single sideband transmitter, the output of this is connected to the mixer:

- a radio frequency oscillator
- b linear amplifier
- c variable frequency oscillator
- d antenna

39-1

The signal from a CW transmitter consists of:

- a an RF waveform which is keyed on and off to form Morse characters
- b a continuous unmodulated RF waveform
- c a continuous RF waveform modulated with an 800 Hz Morse signal
- d a continuous RF waveform which changes frequency in synchronism with an applied Morse signal

40-9

To minimise the radiation of one particular harmonic, one can use a:

- a resistor
- b wave trap in the transmitter output
- c high pass filter in the transmitter output
- d filter in the receiver lead

41-8

Parasitic oscillations tend to occur in:

- a high voltage rectifiers
- b antenna matching circuits
- c SWR bridges
- d high gain amplifier stages

42-2

The following unit in a DC power supply performs a smoothing operation:

- a a fuse
- b a crowbar
- c a full-wave diode bridge
- d an electrolytic capacitor

43-8

In a regulated power supply, "current limiting" is sometimes used to:

- a prevent transformer core saturation
- b protect the mains fuse
- c eliminate earth-leakage effects
- d minimise short-circuit current passing through the regulator

44-7

When conversing via a VHF or UHF repeater, you should pause between overs for about:

- a 3 seconds
- b half a second
- c 30 seconds
- d several minutes

45-5

The standard frequency offset (split) for 70 cm repeaters in New Zealand is plus or minus:

- a 5 MHz
- b 600 kHz
- c 1 MHz
- d 2 MHz

46-7

The AGC circuit is to:

- a minimise the adjustments needed to the receiver gain control knobs
- b expand the audio gain
- c limit the extent of amplitude generation
- d amplitude limit the crystal oscillator output

47-5

The "Q" signal "are you busy?" is:

- a QRM?
- b QRL?
- c QRT?
- d QRZ?

48-5

To obtain efficient transfer of power from a transmitter to an antenna, it is important that there is a:

- a correct impedance match between transmitter and antenna
- b high load impedance
- c low load impedance
- d high standing wave ratio

49-3

A quarter-wave length of 50 ohm coaxial line is shorted at one end. The impedance seen at the other end of the line is:

- a infinite
- b zero
- c 50 ohm
- d 150 ohm

50-0

The support member for the elements of a Yagi antenna is known as the:

- a reflector
- b driven element
- c director
- d boom

51-9

A half-wave antenna resonant at 7100 kHz is approximately this long:

- a 40 metres
- b 20 metres
- c 80 metres
- d 160 metres

52-3

The resonant frequency of an antenna may be increased by:

- a lengthening the radiating element
- b shortening the radiating element
- c increasing the height of the radiating element
- d lowering the radiating element

53-7

The main reason why many VHF base and mobile antennas in amateur use are $5/8$ of a wavelength long is that:

- a most of the energy is radiated at a low angle
- b it is easy to match the antenna to the transmitter
- c it is a convenient length on VHF
- d the angle of radiation is high giving excellent local coverage

54-7

For long distance propagation, the radiation angle of energy from the antenna should be:

- a more than 30 degrees but less than forty-five
- b less than 30 degrees
- c more than 45 degrees but less than ninety
- d 90 degrees

55-7

A variation in received signal strength caused by slowly changing differences in path lengths is called:

- a fading
- b absorption
- c fluctuation
- d path loss

56-4

The type of atmospheric layers which will best return signals to earth are:

- a oxidised layers
- b heavy cloud layers
- c sun spot layers
- d ionised layers

57-3

Which of the following is most likely to cause broad-band continuous interference:

- a poor commutation in an electric motor
- b an electric blanket switch
- c a refrigerator thermostat
- d a microwave transmitter

58-3

To reduce harmonic output from a transmitter, the following could be put in the transmission line, as close to the transmitter as possible:

- a wave trap
- b low-pass filter
- c high-pass filter
- d band reject filter

59-7

The input impedance of an operational amplifier is generally:

- a very high
- b very low
- c capacitive
- d inductive

60-1

In amateur radio service, a "modem":

- a translates digital signals to and from audio signals
- b monitors the demodulated signals
- c de-emphasises the modulated data
- d determines the modulation protocol
