01-3-(a)

The Amateur Service in New Zealand is administered through this prime document:

- a the New Zealand Radiocommunications Regulations
- b the Broadcasting Act
- c the Telecommunications Act
- d the Radio Amateur's Handbook

02 - 7 - (b)

For short periods, you may operate your amateur radio station somewhere in New Zealand away from the location entered in the administration's database:

- a after notifying the MED of your new location by e-mail
- b whenever you want to
- c only after a declared emergency
- d during an emergency traffic exercise

03-4-(c)

A logbook for recording information about stations worked:

- a is compulsory for every amateur radio operator
- b must list all messages sent
- c is recommended for all amateur radio operators
- d must record time in UTC

04 - 7 - (b)

These letters are in general use for the first letters in New Zealand amateur radio callsigns:

- a LZ
- b ZL
- c VK
- d KV

05-1-(b)

A General Amateur Operator Certificate of Competency authorises the use of:

- a a TV receiver for interference tests
- b amateur radio transmitting apparatus only
- c maritime mobile equipment in emergencies
- d all amateur transceivers and test equipment

06-3-(b)

A secret code for the transmission of messages by the operator of an amateur station is:

- a $\,\,$ permitted for emergency messages to be passed on to a government agency
- $\ensuremath{\mathsf{b}}$ not permitted except for control signals by the licensees of remote beacon or repeater stations
- c often used in amateur radio contests
- d only permitted for third-party traffic

07 - 3 - (a)

A station using the callsign "VK3XYZ stroke ZL" is heard on your local VHF repeater. This is:

- a the station of an overseas visitor
- b a confused person, probably with a stolen transceiver
- c an unauthorised callsign
- d an illegal operator

```
08-5-(a)
In New Zealand, the "15 metre band" frequency limits are:
   21.00 to 21.45 MHz
b 21.00 to 21.40 MHz
c 21.00 to 21.35 MHz
d 21.00 to 21.30 MHz
09-5-(b)
The following band used by amateurs is shared with another service in New
Zealand:
a 144 to 146 MHz
b 51 to 53 MHz
   7.0 to 7.1 MHz
d 24.89 to 24.99 MHz
10-1-(a)
Silicon, as used in diodes and transistors, has been doped to become:
    a semiconductor
b a superconductor
c a conductor
d an insulator
11-9-(b)
The name for the flow of electrons in an electric circuit is:
a voltage
b current
c resistance
d capacitance
12-1-(a)
One kilohm is equal to:
a 1000 ohm
   10 ohm
c 0.01 ohm
d 0.001 ohm
13-4-(c)
The voltage to cause a current of 4.4 ampere to flow in a 50 ohm
resistance is:
a 2220 volt
  22.0 volt
c 220 volt
d 0.222 volt
14-1-(a)
A circuit has a total resistance of 100 ohm and 50 volt is applied across
it. The current flow will be:
   500 mA
а
  50 mA
b
    2 ampere
   20 ampere
15-5-(b)
Six identical 2-volt bulbs are connected in series. The supply voltage to
cause the bulbs to light normally is:
a 1.2 V
b 12 V
c 6 V
```

```
d 2 V
16-2-(c)
Five 10 ohm resistors connected in series give a total resistance of:
   1 ohm
  5 ohm
  50 ohm
С
d
  10 ohm
17 - 0 - (c)
Two 120 ohm resistors are arranged in parallel to replace a faulty
resistor. The faulty resistor had an original value of:
   15 ohm
h
   30 ohm
  60 ohm
С
d
   120 ohm
18-6-(c)
A 20 ohm resistor carries a current of 0.25 ampere. The power dissipated
    5 watt
а
  2.50 watt
h
  1.25 watt
  10 watt
d
19-8-(b)
A current of 10 ampere rms at a frequency of 50 Hz flows through a 100
ohm resistor. The power dissipated is:
  500 watt
b 10,000 watt
   707 watt
С
  50,000 watt
20-3-(d)
The current in an AC circuit completes a cycle in 0.1 second. So the
frequency is:
   1 Hz
  1000 Hz
b
c 100 Hz
  10 Hz
d
21-6-(a)
Capacitors and inductors oppose an alternating current. This is known as:
a reactance
b resistance
c resonance
d conductance
22-4-(a)
A transformer with 500 turns on the primary winding and 50 turns on the
secondary winding has its primary winding connected to 230 volt AC mains.
The voltage across the secondary is:
  23 volt
  10 volt
c 110 volt
d 2300 volt
23-2-(a)
```

```
Wires carrying high voltages in a transmitter should be well insulated to
avoid:
   short circuits
b overheating
c over modulation
d SWR effects
24-3-(d)
A bipolar transistor has three terminals named:
a base, emitter and drain
b collector, base and source
c drain, source and gate
d emitter, base and collector
25-0-(b)
A varactor diode acts like a variable:
  resistance
b capacitance
c voltage regulator
d inductance
26-9-(a)
A triode valve has this many grids:
   one
h
   t.wo
c three
d three plus a filament
An rms-reading voltmeter is used to measure a 50 Hz sinewave of known
peak voltage 14 volt. The meter reading will be about:
a 14 volt
   28 volt
c 10 volt
d 50 volt
28-5-(d)
An attenuator network has 10 volt rms applied to its input with 1 volt
rms measured at its output. The attenuation of the network is:
  6 dB
  10 dB
С
   40 dB
d 20 dB
29 - 9 - (a)
In an HF station, the connection between the "antenna tuner" and the
"antenna feed-point" could be made with:
a 50 ohm coaxial cable
b
   three-wire mains power cable
  heavy hook-up wire
d an iron-cored transformer
30-1-(b)
In a frequency modulation receiver, this is in between the antenna and
the mixer:
   the audio frequency amplifier
  the radio frequency amplifier
c the high frequency oscillator
```

```
the intermediate frequency amplifier
31-4-(d)
In a single sideband and CW receiver, this is located between the mixer
and intermediate frequency amplifier:
   the radio frequency amplifier
  the beat frequency oscillator
  the product detector
d a filter
32 - 0 - (c)
The frequency stability of a receiver is its ability to:
   track the incoming signal as it drifts
    provide a frequency standard
   stay tuned to the desired signal
   provide a digital readout
33-4-(d)
The stage in a superhet receiver with a tuneable input and fixed tuned
output is the:
   RF amplifier
  IF amplifier
   local oscillator
d
  mixer stage
34-4-(c)
A superhet receiver, with a 500 kHz IF, is receiving a signal at 21.0
MHz. A strong unwanted signal at 22 MHz is interfering. The cause is:
  insufficient IF selectivity
  the 22 MHz signal is out-of-band
    22 MHz is the image frequency
   insufficient RF gain
35-5-(a)
The mixer stage of a superheterodyne receiver is used to:
    change the frequency of the incoming signal to that of the IF
    allow a number of IF frequencies to be used
   remove image signals from the receiver
    produce an audio frequency for the speaker
36-2-(d)
The primary source of noise that can be heard in a UHF band receiver with
its antenna connected is:
a detector noise
b atmospheric noise
c man-made noise
d receiver front-end noise
37-1-(a)
In a frequency modulation transmitter, the microphone is connected to
a speech amplifier
b modulator
c power amplifier
d oscillator
38 - 3 - (a)
```

```
In a single sideband transmitter, the output of this is connected to a
sideband-selecting filter:
   balanced modulator
  microphone
h
c mixer
   radio frequency oscillator
39-5-(a)
Several stations advise that your FM simplex transmission in the "two
metre" band is distorted. The cause might be that:
a the transmitter modulation deviation is too high
b your antenna is too low
   the transmitter has become unsynchronised
   your transmitter frequency split is incorrect
40-5-(b)
Harmonics produced in an early stage of a transmitter may be reduced in a
later stage by:
    increasing the signal input to the final stage
    using tuned circuit coupling between stages
   using FET power amplifiers
   using larger value coupling capacitors
41-6-(c)
Parasitic oscillations in the RF power amplifier stage of a transmitter
may occur:
a at low frequencies only
b on harmonic frequencies
c at high or low frequencies
  at high frequencies only
42 - 7 - (a)
A half-wave DC power supply operates from the New Zealand AC mains. The
ripple frequency will be:
   50 Hz
а
  25 Hz
h
С
   70 Hz
d 100 Hz
43-0-(d)
A filter is used in a power supply to:
a filter RF radiation from the output of the power supply
b restore voltage variations
c act as a 50 Hz tuned circuit
   smooth the rectified waveform from the rectifier
44-0-(c)
The correct order for callsigns in a callsign exchange at the start and
end of a transmission is:
   your callsign followed by the other callsign
   your own callsign, repeated twice
   the other callsign followed by your own callsign
   the other callsign, repeated twice
45-3-(b)
A repeater operating with a "positive 600 kHz split":
  transmits on a frequency 600 kHz higher than its designated frequency
```

b listens on a frequency 600 kHz higher than its designated frequency

```
transmits simultaneously on its designated frequency and one 600 kHz
higher
   uses positive modulation with a bandwidth of 600 kHz
The "split frequency" function on a transceiver allows the operator to:
  monitor two frequencies simultaneously using a single loudspeaker
  transmit on one frequency and receive on another
c monitor two frequencies simultaneously using two loudspeakers
d receive CW and SSB signals simultaneously on the same frequency
47 - 3 - (a)
The question "who is calling me?" is asked by:
   QRZ?
   QRM?
b
   QRP?
C.
  ORT?
48-7-(b)
An RF transmission line should be matched at the transmitter end to:
  prevent frequency drift
  transfer maximum power to the antenna
  overcome fading of the transmitted signal
   ensure that the radiated signal has the intended polarisation
49-8-(c)
This commonly available antenna feedline can be buried directly in the
ground for some distance, without adverse effects:
   75 ohm twinlead
  300 ohm twinlead
  coaxial cable
  600 ohm open-wire
50-4-(d)
A centre-fed dipole antenna for HF working can be made to operate on
several bands, if the following item is installed at points in each leg:
  a capacitor
  an inductor
b
   a fuse
   a parallel-tuned trap
51-2-(d)
An antenna which transmits equally well in all compass directions is a:
a dipole with a reflector only
b dipole with director only
c half-wave horizontal dipole
d quarter-wave grounded vertical
52 - 9 - (a)
A vertical antenna which uses a flat conductive surface at its base is
a quarter-wave ground plane
b vertical dipole
c rhombic
d long wire
53-0-(c)
The main characteristic of a vertical antenna is that it:
```

```
a requires few insulators
b is very sensitive to signals coming from horizontal aerials
c receives signals from all points around it equally well
   is easy to feed with TV ribbon feeder
54 - 3 - (b)
Solar cycles have an average length of:
a 1 year
b 11 years
c 6 years
d 3 years
55-3-(a)
Signal fadeouts resulting from an "ionospheric storm" or "sudden
ionospheric disturbance" are usually attributed to:
    solar flare activity
  heating of the ionised layers
b
c over-use of the signal path
   insufficient transmitted power
56-6-(c)
The skip distance of a sky wave will be greatest when the:
   ionosphere is most densely ionised
  signal given out is strongest
c angle of radiation is smallest
d polarisation is vertical
57-6-(d)
A neighbour's stereo system is suffering RF break-through. One possible
cure is to:
a put a ferrite bead on the transmitter output lead
   put a capacitor across the transmitter output
   use open-wire feeders to the antenna
d use screened wire for the loudspeaker leads
58-4-(d)
To reduce energy from an HF transmitter getting into a television
receiver, the following could be placed in the TV antenna lead, as close
to the TV as possible:
   active filter
  low-pass filter
c band reject filter
d high-pass filter
59-0-(c)
A low-pass filter may be used in an amateur radio installation:
  to attenuate signals lower in frequency than the transmission
   to boost the output power of the lower frequency transmissions
   to attenuate signals higher in frequency than the transmission
  to boost the power of higher frequency transmissions
60-6-(c)
When your HF digital transmission is received with errors due to multi-
path conditions, you should:
a increase transmitter power
b reduce transmitter power
  reduce transmitted baud rate
d change frequency slightly
```
